Sorry Kirk K6KAR. Wish this mode had a chat facility like ROS Hi!. Apparently I have just been connected to you on 14.073, but didn't know how to respond, or what I was sending to you automatically so had to requested disconnect before I tied your station up or something. I was starting out with FEC mode only for now as only just set up today. Need to gen up on ARQ now.

Brian

2875. RE: [V4Protocol] Trialling v. 1.0.4.0 experiments

Yahoo group: V4Protocol
Date: 2012-07-27 10:00:35 UTC
From: Robin Hodgson
Topic: 2867 Message: 2875

I have finally had a satisfactory 20 meter V4 QSO with another station (M0SFR) 2000km away, in which the process worked exactly as
the HELP section describes.
So why do we have problems trying to work 3 km distance? In trials, ARQ connect completes both on 20m and 30m bands.
But the transfer of text is problematic, as described before. Could this be related to the fact that my Kenwood TS850S
has a typical latency of 50ms, while the other station is using a FLEX and is experiencing typical latency figures around 200ms?
The only other difference is that I receive strong signals from the other station, while he receives much weaker signals from me.
This asymmetry is due to power output and antenna configuration differences between us.

Robin, 9H1ZZ

Subject: [V4Protocol] Trialling v. 1.0.4.0 experiments

Having no experience with any ARQ protocol before, I had been playing with V4Chat for several months, with little success. I have now installed v.1.0.4.0 and also persuaded a nearby (3 km away) ham to do the same.

After sorting out the T>R latency issues, we succeeded in getting reliable ARQ connects between us. However we are having difficulty mastering the IRS to ISS switch (and v.v), which should be automatic, once connected.

The data we enter in the text box remains there even after invoking a "send command" or hitting the Queue Data button. Sometimes some of the data does get transferred to the OB Queue and is registered on the OB counter. How do you know what text has already been queued (or sent) and what is still waiting? Surely the data should disappear (or change color or something) from the text box once it is in the OB queue? Do we have to edit it out by hand?

Sometimes the data transfer does work as described in the HELP section. But we are regularly seeing error messages such as "IDL Received as ISS and queue not empty. No switch to IRS" being presented. On investigating, we find that when this happens, both stations' V4TNC screen are reporting they are in an ISS state, and the session times out.

Being newbies, we would like to know what we are doing wrong, and appreciate any comments from this group.

Thanks and 73 Robin, 9H1ZZ

Hi there,

I am the station with which Robin had his successful QSO on 20m, reported below . I was running 100W into an end-fed dipole 8m AGL and the conditions were reasonably good (got 28db S/N from Iceland, a similar distance away, on the reverse beacon network around the same time). However, Robin's signal was weak, causing a lot of retransmissions in both directions.

I did not upgrade to the new version of V4CHAT, so can't comment on the problems below, but under the old version I had no problems whatsoever sending and receiving when the signal was reasonably strong.

Here the rig is IC-7200 and I use its built-in USB sound card, which I understand is reasonably low latency.

Just for your information.

73s,

Alex M0SFR

I heard/read a cq from 7x4dr and answered resulting in a connection confirmed. My station then kept sending a short burst of data until finally timing out. No text was received from 7x4dr. As I'm like really new to this mode (arq) what actually happened there?. Was I supposed to stop my transmission in some way after the connection was made to allow the other station to tx, which I assumed would be done automatically anyway.
Cheers, Brian

OK,
Tried to connect with KJ1J, but just couldn't get the link to be stable.. We were up and down a couple of times..
I saw K1CKK in there for a few minutes, but wasn't able to try to connect..
Had a nice QSO with KE1AF, Abel, even with the QSB that was going on..Signals were going from 599 to down in the noise.. Finally faded after a while though..
By that point I had to get going..
Fun Stuff!

BTW I'm located near Chicago, EN51ww

The ADIF file created by V4 has a lot of extraneous data, including "logs" for every time you call CQ. This is probably what is causing TQSL trouble.

You will probably need to edit the ADIF in another program to remove all of the non-QSO data. I use HRD Logbook for all of my logging, and it has the ability to upload to LoTW from within the logbook itself (no need to use TQSL or go to the LoTW website). You can also try ADIF Master (http://www.dxshell.com/adif-master.html) to just view and edit ADIF files.

Hope this helps!

While we're on the subject of LoTW and V4, you will probably want to set TQSL to change V4 to DATA when signing your ADIF file. LoTW doesn't recognize V4 as a valid mode.

In TQSL, select "File", "Preferences...", "ADIF Modes". Select "Add..." to add a new mapping. Type V4 into the box, then select DATA from the list of modes.

This will result in LoTW getting your V4 contacts as a generic "DATA" mode contact. It's not as pretty, but LoTW treats all digital modes as "DATA" anyway for QSL purposes. (See here for info on how LoTW matches QSLs: https://p1k.arrl.org/lotwuser/faq#datamatch)

Topic: 2893 Message: 2896

Hello James,
That's exactly right! Thank you explaining this. I also tried to upload the file to eQSL and I saw all my CQs were part of the file. That certainly won't stop me from using and enjoying this mode. I wonder James, do you know which frequency is used for V4 Chat on 30 meters? I tried both 10.131 and 10.136 but I'm not sure which is the most popular. I did see a signal on 10.136 last night but no matter what I did I could not decode it. I was thinking could that have been Winmor?
Thanks again, very 73 Glenn

I use HRD Logbook for all of my logging, and it has the ability to upload to LoTW from within the logbook itself (no need to use TQSL or go to the LoTW website). You can also try ADIF Master (http://www.dxshell.com/adif-master.html) to just view and edit ADIF files.

Thanks James,
I have been calling on 10.136 and 10.131 in the evening, but no contacts yet. I have had some success on 14.073 but the conditions have been very poor.
I was told that the mode is gaining in popularity, so there should be more of a chance as time goes on.

2904. V4 vs ALE400

Yahoo group: V4Protocol
Date: 2012-08-11 14:14:50 UTC
From: DigitalHillbilly
Topic: 2904 Message: 2904

All,
Both myself and Kirk (K6KAR) did some testing on 20 meters yesterday. We tried V4 vs ALE400, V4 beat ALE400 in both performance and ease of use. ALE400 seems very confusing at times where V4 is pretty straight forward. ALE400 had many more retries then V4 did. V4 appears to be much more robust. I wonder if anyone else has tried something similar?
I have been QRV on 14.073 during the day, but I can't always be in the shack,so I missed two other stations who called CQ yesterday darn it!
Very 73 to all, Glenn WB2LMV

From: Rick Muething
Topic: 2904 Message: 2905

Glen,

Thanks for the post and the tests. I have not had the chance to compare V4 to ALE400 over the HF simulator where it is possible to create repeatable channels for testing.

V4 could be made more robust by using more bandwidth (currently 200 Hz wide vs. ALE400's 400 Hz). I am experimenting with a new expansion of V4 using narrow bandwidth (400-500 Hz) CHIRP modulation (continuously varying FSK). Which looks promising to be very robust over poor multipath conditions (e.g. Polar transmissions, severe selective fading) It will take a while to refine the math and DSP needed for this modulation and to integrate the CHIRP option into the V4Chat software.

73,

Rick Muething, KN6KB

Hello Rick,
It was during fading that the V4 program did better, and for some reason and I do not know why, the V4 program was running about 2 s units stronger on peaks. Maybe due to a more concentrated audio response from the soundcard?
It isn't often anymore where we all are experencing good band conditions, so any mode that can print at 100% and not crawl along is a plus. I always liked Olivia because it performed well, but it is very slow and if I used a different configuration to speed things up some, I would lose data. I enjoy the speed of V4 because I am not a fast typist and I don't feel as if I'm being chased by a wide boar trying to keep up with the buffer. Thanks for a great program.

I have to disagree with the idea V4 is more robust than ALE400. If ALE400 is having retries, a vital setting in ALE400 was missed.

Assuming MultiPSK is being used, click on Options in the ALE400 screen (1/3 the way from the top, in the middle almost). Inthe Options screen at the bottom, click on "Additional waiting delay of one second...."

I have been successfully using ALE400 for almost 2 yrs every day to communicate with K1DOW in Florida on 20 and 30 mtrs and the 1 sec delay addition fixed our link issues and data flow...it is flawless.

Yesterday AM we tested ALE400 running 1/2 watt and had perfect flow and connection on 14074 for almost 30 minutes.

I installed V4 and tuned to 14073. As soon as V4 got control over the radio it switched to VFO A which was on a different frequency. No matter, I switched back to B. Now the TNC shows the wrong dial frequency but I don't think that matters much.

Anyway, I listened for a while and called CQ, usinf 40W. I'll leave it running for a while longer.

Hi Jakob,

my tuner problems were easily fixed by restarting my TS-2000 and
tightening all antenna connections. I'm not sure yet what the root cause
was but it's working again.

I just called you with a 14073 dial frequency, 14074.5 CF, using 40W.
Doing trans atlantic V4 on 5W would be great but from what little I know
about it that's not likely to work. TJ65 is a different story of course :-)

Topic: 2904 Message: 2919

What type of soundcard interface were you using for the test ??

ALE400 does not work as well as it can using VOX type interfaces,,(Signalink,etc)

Thats why the change in settings for the 1sec delay that the other poster said.

Using hard PTT(serial port/USB serial port) -- It works great out of the box.

I also have been using ALE400 for years, and find it hard to beat(for the cost..lol)

Glenn,
Well there are always a tradeoffs of speed, bandwidth and robustness...goes back to Shannon’s theorm I think. (Part of what I sometimes refer to the “no free lunch” theorem!). In general FSK is better for robustness than PSK especially in poor multipath channels. The idea I have with CHIRP is it is like FSK but the tone continuously changes (chirps) throughout the symbol so it is more immune to selective fading which can wipe out a particular single frequency FSK carrier like is used in V4, Pactor 1, Olivia etc. Chirp has been used extensively in some radars and Sonar but is generally wider bandwidth there of course.

In properly written DSP code amplitudes (if used) are generally ratioed during demodulation so absolute levels are not that important provided they don’t saturate the sound card. We are generally working with fairly weak signals (often 20 db S/N or less) so the full range of a 16 bit A-D (about 90 dB) is not usually used provided the radio has AGC.

Still much too early to know how effective narrow band CHIRP will be for keyboard text (I’m targeting something > 40 words per minute in < 500 Hz) but at least I’ll probably learn something along the way!!!

Hello Rick,
It was during fading that the V4 program did better, and for some reason and I do not know why, the V4 program was running about 2 s units stronger on peaks. Maybe due to a more concentrated audio response from the soundcard?
It isn't often anymore where we all are experencing good band conditions, so any mode that can print at 100% and not crawl along is a plus. I always liked Olivia because it performed well, but it is very slow and if I used a different configuration to speed things up some, I would lose data. I enjoy the speed of V4 because I am not a fast typist and I don't feel as if I'm being chased by a wide boar trying to keep up with the buffer. Thanks for a great program.
Very 73, Glenn WB2LMV

Rick,
I know that most who have read your post about the Chirp mode will be anxiously awaiting it's release! Me too! I know that as a digital mode operator I am always looking forthe mode that can print signals which are way below the noise level. JT65 and WSPR prove that it can be done, but those are not good for chats, so there is always that trade off. (-= I also like the modes that are not too wide, with all the different modes, and we each have a favorite, we really need to be able to share the little bandwidth that we have without interfering with one another. PSK10 is VERY narrow but the throughput is VERY slow. So I'm ready when you are to start using the new Chirp!

2930. ARQ protocols used over RF links

Yahoo group: V4Protocol
Date: 2012-08-15 15:04:12 UTC
From: Robin
Topic: 2930 Message: 2930

In all practical trials of V4Chat (1.0.4.0) I have performed, the protocol gets jammed owing to both stations continuously claiming ISS simultaneously! This should not be possible. I am having problems understanding how the mechanism used to swap IRS<=>ISS should work.
Being a newcomer to this mode, can I put a beginners question to the group?
There is a limit defined for the T>R latency, presumably to ensure the synchronisation of ACK/NAK responses after sending an ARQ frame. But what about the latency R>T of the partnering transmitter? This is not mentioned in the documentation.
Suppose the answering transmitter (sending the ACK/NAK) takes a "long" time to initiate modulated RF after its PTT has been activated, surely this can also provoke problems? As far as I can see from the logs, the frames are not uniquely identified (un-numbered) so with extreme unbalanced latencies and timing, it could be possible to lose co-ordination between ARQ data frames and the related ACK/NAK.

Appreciate any thoughts or comments from the experts.

2932. Re: [V4Protocol] ARQ protocols used over RF links

Yahoo group: V4Protocol
Date: 2012-08-15 17:00:46 UTC
From: Rick Muething
Topic: 2930 Message: 2932

Robin,
Some good questions...the answers are technical but I will try and summarize here.
1) There is a limit on T>R latency (< 250 ms) to maintain some performance in the protocol. For example in Pactor this is typically on the order of 50 ms and is fixed by the hardware and radio. Almost any computer and radio can make the 250 ms limit unless something incorrectly is set up ....like the PTT hold (DLY on the SignaLink) is set too high.

2) The program measures upon the first ACK received (during the establishment of a connection) the nominal delay from the release of its PTT to the reception of the ACK. This include the R>T latency on the remote end and therefore this is automatically measured (again with a fairly generous limits) This is used (with some safety margin) to determine what delay the ISS uses before sending the next frame.

3) There is a fairly reliable and usually bullet proof way of IRS<>ISS changeover. If you are experience problems with this I need to see the debug log files from EACH end to make any analysis. There is a lot of information in the debug log along with timing measurement to 10 ms but you have to be intimately familiar with the code (and have the source in front of you) to be able to accurately interpret it. EVERY half duplex ARQ mode has this issue when transitioning from ISS to IRS. The goal is to have a completely bulletproof exchange under ALL combinations of missed requests and ACKs...it it generally not possible to reach perfection especially in very poor channels. The exchange of the IRS and ISS in V4 has been tested down to S/N of − 5 dB in poor multipath channels but as I said perfection is generally not possible.

If you have detailed questions on the change over mechanism and states I will try and answer but looking at the text and diagrams in the V4 Protocol spec should be the best help.

Glenn,

V4 is an accepted and enumerated mode in the 3.0.2 release of the ADIF spec http://www.adif.org/adif302.htm#Mode%20Enumeration (V4Chat is not used as a mode in the log...V4Chat is the program that provides the user interface to the V4 TNC which implements the V4 Protocol).

It seems to me a more appropriate request would be to have DXkeeper and/or LOTW update to the new ADIF 3.0.2 spec (which then should recognize V4) rather than to have V4 Chat strip the mode enumeration out of its V4Chat ADIF log that is ADIF 3.0.2 compliant.

Subject: Re: [V4Protocol] ARQ protocols used over RF links

Robin,
Some good questions...the answers are technical but I will try and summarize here.
1) There is a limit on T>R latency (< 250 ms) to maintain some performance in the protocol. For example in Pactor this is typically on the order of 50 ms and is fixed by the hardware and radio. Almost any computer and radio can make the 250 ms limit unless something incorrectly is set up ....like the PTT hold (DLY on the SignaLink) is set too high.
Rick, I am sure you have done a thorough analysis on this.
When PTT is released, all RF transmission ceases. Practically no delay. Then the receiver recovers rapidly.
But when PTT is activated, the carrier will be switched on and simultaneously the AFSK data modulation process is initiated. Although RF should stabilise rapidly, in practice, certain transceivers do seem take quite some time (personally, I suspect the problem lies with their ALC circuitry and a switch-on glitch).

2) The program measures upon the first ACK received (during the establishment of a connection) the nominal delay from the release of its PTT to the reception of the ACK. This include the R>T latency on the remote end and therefore this is automatically measured (again with a fairly generous limits) This is used (with some safety margin) to determine what delay the ISS uses before sending the next frame.
So you keep on repeating the same frame (about every 5 seconds) until an ACK is received. But you don't know which frame it is acknowledging, and the roundtrip figure is based on the assumption that it IS the last sent frame?

3) There is a fairly reliable and usually bullet proof way of IRS<>ISS changeover. If you are experience problems with this I need to see the debug log files from EACH end to make any analysis. There is a lot of information in the debug log along with timing measurement to 10 ms but you have to be intimately familiar with the code (and have the source in front of you) to be able to accurately interpret it. EVERY half duplex ARQ mode has this issue when transitioning from ISS to IRS. The goal is to have a completely bulletproof exchange under ALL combinations of missed requests and ACKs...it it

generally not possible to reach perfection especially in very poor channels. The exchange of the IRS and ISS in V4 has been tested down to S/N of – 5 dB in poor multipath channels but as I said perfection is generally not possible.

If you have detailed questions on the change over mechanism and states I will try and answer but looking at the text and diagrams in the V4 Protocol spec should be the best help.

Thanks Rick, I will prepare our logs and send you (off list) a more detailed description of our trials.
S/N of > +30dB over a 3km path on 20 meters. The IRS<=>ISS switch-over hangup is reproducible.

Topic: 2930 Message: 2943

Robin,

As simple as you make it sound the real world is a bit different!
The PTT release is called for by the ending of the playing of the transmitted audio...At the instant the audio quits being played by the sound card several things happen:
1) The sound device notifies the OS of the buffer status (not playing)
2) The polling algorithm detects a change in the buffer status which sends a PTT off command via TCPIP to the host program.
3) The host program decodes the PTT OFF TCP command and determines (based on the setup) what to do.
a) Nothing for VOX (or audio keyed PTT like the SignaLink)
b) Change the Value of the DTR or RTS signal on a dedicated RS232 port if that keying option is used.
c) Send a “CAT” PTT OFF command if the setup is for a transceiver that supports PTT commands. (many but not all do). This is usually via a serial port with some delay.

So you see that the above must happen and in general none of this is instantaneous so they could be up to 100 ms or more delay and this adds to the T>R latency that is inherent to the radio (not trivial on some DSP based radios). When the latency is measured (during a call) the time from 1) above to the reception of background receiver noise is measured. (which also includes the Radio latency, inbound sound card latency and OS interrupt latency). Those measurements are not super precise since the OS is not truly real-time but in general are repeatable to about 30 ms which is close enough.

When the program measures the round trip time it uses a specific time windows (rather small...about 1500 ms) that it expects the ACK to be received this insures it measures from a specific PTT Release. It will attempt a measurement on each connect request until it gets a good ACK decode and a time that fits into the expected window. If the Round trip delay measurement is outside this window it won’t be used and a safe high value will be used (but the link will not run at optimum speed. This works very well and as long as the user does not have substantial VOX delay set (or DLY on the SignaLink) it will work fine for almost all radios and sound card interfaces.

The IRS<> ISS switchover is more complex. It has to be interlocked so you don’t get two ISS or Two IRS at the same time....that will kill the link. Think of the ISS as the master...it always initiates the action and the IRS responds to the command. In the changeover those roles have to be reversed. That can be very complex if the change over request, or ACK or both are missed (which happens fairly often on HF) There is a mechanism which I described and is documented in the spec that usually is very reliable. If both stations measure the latencies above it should be very solid. If one station is not calculating the latency or Round trip there could be issues with ISS<>IRS switchover. But to analyze that I need the debug logs of both ends along with the information on your setup (how PTT keying is done etc). One important thing which is mentioned in the help is if using radio control (CAT PTT control) the baud rate should be 4800 or above...otherwise that can add substantial delay to the PTT key/release.

I'll be happy to take a look at the logs. (Send COMPLETE logs ...not snippets) as attachments. I will be camping this weekend with my family so won't have internet until Monday.

73,

Rick KN6KB

Subject: Re: [V4Protocol] ARQ protocols used over RF links

Robin,
Some good questions...the answers are technical but I will try and summarize here.
1) There is a limit on T>R latency (< 250 ms) to maintain some performance in the protocol. For example in Pactor this is typically on the order of 50 ms and is fixed by the hardware and radio. Almost any computer and radio can make the 250 ms limit unless something incorrectly is set up ....like the PTT hold (DLY on the SignaLink) is set too high.
Rick, I am sure you have done a thorough analysis on this.
When PTT is released, all RF transmission ceases. Practically no delay. Then the receiver recovers rapidly.
But when PTT is activated, the carrier will be switched on and simultaneously the AFSK data modulation process is initiated. Although RF should stabilise rapidly, in practice, certain transceivers do seem take quite some time (personally, I suspect the problem lies with their ALC circuitry and a switch-on glitch).

2) The program measures upon the first ACK received (during the establishment of a connection) the nominal delay from the release of its PTT to the reception of the ACK. This include the R>T latency on the remote end and therefore this is automatically measured (again with a fairly generous limits) This is used (with some safety margin) to determine what delay the ISS uses before sending the next frame.
So you keep on repeating the same frame (about every 5 seconds) until an ACK is received. But you don't know which frame it is acknowledging, and the roundtrip figure is based on the assumption that it IS the last sent frame?

3) There is a fairly reliable and usually bullet proof way of IRS<>ISS changeover. If you are experience problems with this I need to see the debug log files from EACH end to make any analysis. There is a lot of information in the debug log along with timing measurement to 10 ms but you have to be intimately familiar with the code (and have the source in front of you) to be able to accurately interpret it. EVERY half duplex ARQ mode has this issue

when transitioning from ISS to IRS. The goal is to have a completely bulletproof exchange under ALL combinations of missed requests and ACKs...it it generally not possible to reach perfection especially in very poor channels. The exchange of the IRS and ISS in V4 has been tested down to S/N of – 5 dB in poor multipath channels but as I said perfection is generally not possible.

If you have detailed questions on the change over mechanism and states I will try and answer but looking at the text and diagrams in the V4 Protocol spec should be the best help.

Thanks Rick, I will prepare our logs and send you (off list) a more detailed description of our trials.
S/N of > +30dB over a 3km path on 20 meters. The IRS<=>ISS switch-over hangup is reproducible.

73,

Rick Muething, KN6KB

Subject: [V4Protocol] ARQ protocols used over RF links

In all practical trials of V4Chat (1.0.4.0) I have performed, the protocol gets jammed owing to both stations continuously claiming ISS simultaneously! This should not be possible. I am having problems understanding how the mechanism used to swap IRS<=>ISS should work.
Being a newcomer to this mode, can I put a beginners question to the group?
There is a limit defined for the T>R latency, presumably to ensure the synchronisation of ACK/NAK responses after sending an ARQ frame. But what about the latency R>T of the partnering transmitter? This is not mentioned in the documentation.
Suppose the answering transmitter (sending the ACK/NAK) takes a "long" time to initiate modulated RF after its PTT has been activated, surely this can also provoke problems? As far as I can see from the logs, the frames are not uniquely identified (un-numbered) so with extreme unbalanced latencies and timing, it could be possible to lose co-ordination between ARQ data frames and the related ACK/NAK.

Appreciate any thoughts or comments from the experts.
Robin, 9H1ZZ

Rick -

I had a V4 Chat QSO with David WB6JFHon 14.073 MHz today and noticed what appeared to be malformed data packets (i.e. not ACK/NAK's) from him. The "malformed" phenomena I speak of is most of the energy was concentrated into the lowest tone frequency (though there was a slight amount in the higher tone frequencies). No data was decoded from these packets. I noticed it both in ARQ and FEC mode. I've attached a screen shot of the phenomena. I've attached a debug log. One of the times I saw this occur was late in the minute of 1:40 pm PDT.

I have not seen this reported before. Sorry if this is old news.

73, Bill K1CT

Hi Jakob and Ian. I have never succeeded any VK in any mode...just G5RV antenna. Germany, UK, Ireland, Österreich and Sweitz use to work. Sorry, not now. Yussi has worked me well earlier.

The new bug fix of time of day adaption of propagation estimates from Voacap in RMS Express from ITSHFBC may be a good hint from last version 1.2.4.0, or using AirMail.

Better luck next time. Wonderful solid mode.

Date: 2012-09-23 17:48:39 UTC
From: Leo yudysky
Topic: 2960 Message: 2967

Thanks for the frequency for V4, 10.133, I'm interested in that band and getting more use out of it. I've been on 20 meters but its kinda quiet except for an occasional Oliva qso.

Ian, According to VOACAP.COM some 08-12 UTC 24933.0 might be usable. Before or after 21.073.0 . Nothing possible for now. I might try in abt 12 hours. 73 Finn/LA7UM

2968. 30 Meter Multi Mode Weekend ☐ 27/28 October 2012

Yahoo group: V4Protocol
Date: 2012-10-13 15:25:22 UTC
From: Don
Topic: 2968 Message: 2968

30 Meter Multi Mode Weekend

When: October 27th and 28th 2012

Where: 10 MHz - 30 Meter Band (10.100 ☐ 10.150)

Objective: To promote experimenting and using different digital modes on the unique 30 Meter Band.

For a more detailed listing of this event go here:
http://www.30mdg.net/news.html

(You are welcome to post this event information to your other digital friends, Clubs, Yahoo/Google Groups, other Ham Related Websites, etc ☐ please DO help us promote this event - the more that participate the more fun for al and thanks to those that participate on the 30 Meter Band!)

The 30 Meter Digital Group (30MDG) is celebrating .5 year Anniversary, 6,000 members (120DXCC), and our 30MDG Award Program issuing over 31,000 Award Certificates. 30MDG is FREE to join, FREE Awards program with FREE Award software ☐ Ultimate 30 or U30).

GL and as always this is NOT a contest ☐ no start or stop times, no exchanges, no logs to send to anyone, no winners or trophy ☐ this IS to PROMOTE AWARENESS of the 30 METER BAND and the only winners are those that participate and have fun!

Don KB9UMT 30MDG#0001-Founder
And the 30MDG "Team"

2969. On 10.133 Dial Freq.

this is ke5htb I going to try 28.123 for a spell also saw a
signal but I havent used this program in ages and wanted to see
myself that it still worked and remember how to use it even. last
contact and only 1 was in 2011 on 40m even. I will be there for a
hour trying and listening.

Topic: 2996 Message: 2998

Frequency 14.073 all times UTC here... The station was weak
but printed out about three lines CQ call. Too much QRM and possibly
he left the frequency before I got back to him.

14.073 is very quiet here in Edinburgh . Maybe have to rig a 40 metre
dipole:)

John

2999. Announcing CAT590: Generating and Monitoring TS-590S CAT Commands and Responses

Yahoo group: V4Protocol
Date: 2012-11-01 18:31:04 UTC
From: Ian Wade G3NRW
Topic: 2999 Message: 2999

I recently needed a simple tool to create and monitor TS-590S CAT control commands and responses. The result was CAT590.

CAT590 is a diagnostic program that lets you send TS-590S computer control commands from the PC to the radio, then monitors the responses from the radio. CAT590 is an Excel VBA program, and requires Excel to run.

The program is very easy to use. After connecting the program to the radio, you simply enter a CAT command (for example, "FA;" to read the VFO-A frequency), then click on the "Send Command" button to send the command to the radio. The response from the radio (for example, "FA00007124000;") then appears.

To download the CAT590 program and associated documentation, go to the "TS-590S Resources Page":

http://homepage.ntlworld.com/wadei/ts-590s.htm

Click on the red "CAT950" button. A short description of the program will appear, together with links for the software and documentation.

3000. RE: [V4Protocol] Announcing CAT590: Generating and Monitoring TS-590S CAT Commands and Responses

Yahoo group: V4Protocol
Date: 2012-11-01 21:09:10 UTC
From: Box SixteenHundred
Topic: 2999 Message: 3000

I had written a similar program for my TS-870S 5-6 years ago.

I then wired up a sharp IR detector to an Arduino microprocessor and
now use an old TV remote to control my radio from my recliner in
the other room.

A word of warning.

Be very careful using tools like these.

Entering an incorrect code or command or writing to the wrong eeprom
location can cause the radio to be bricked.

Hello ,

Did not realize that this is software you have to pay for.

I was SWL manager of the national amateur radio societies of
Holland and Belgium, contest manager of the UBA, 12 years club president,
35 years organising Jamboree on the Air, gave at least 50 presentations
in radio clubs, wrote numerous articles for radio amateur magazines,
manning stands for radio clubs on all kinds of occasions, etc. etc.
Never ever ask any payment for that.

Now I am a volunteer for the Doctors without Borders who in my opinion
deserve my personal and financial support just as much or even more than
the emergency organisation the payment of this software is benefiting from.

Good luck with the hobby!

Well maybe Monday then? I tried 14073 and 14075 but did not hear anyone except some JT65 and Oliva.
My beam froze at 90 degrees so I will try again to the east coast from here in Montana until the bearing thaws out. I thought I had that fixed, I put a rubber boot on the top of the tower to shed the water away from the top platform where the brass bearing is. Just enough water must slip in this bearing and freezes. I have two more bearing supports below that then the rotor sits 3 feet down in the tower.

Paul, and group
Lets try that again, at the same time which I hope is good for you. This would be 3:30pm local mountain time here in Montana and 20 meters should still be fine at that time.
I find leaving the V4 program 'on' helps grab contacts too. I've made a few contacts awhile ago, but it seems to be tapering off we'll see. Its such a great chat program I've recommended it to our ARES committee as a good program to pass critical information on. I was looking yesterday on 14.073, heard some Oliva so I had a great QSO with a fellow in California. I've been on V4 in the midst of Oliva and it doesn't seem to bother at all.

All

I'm seeing about 380ms on delay with my Flex 3000 when calling CQ. Went through all the stuff in the help files, is there a some sort of magic that you have to do to the delays down?

I am running Virtual Serial Port instead of the COM0 stuff as this program runs native under Windows 64 as a signed program.

Thanks

3032. Re: [V4Protocol] Flex...delay

Yahoo group: V4Protocol
Date: 2012-12-25 01:38:35 UTC
From: wb0kgn@q.com
Topic: 3028 Message: 3032

On my TS480sat, I discovered that there was a vox delay that affected "everything". Digimodes, c.w., and everything. Adjusting that made a big difference.

Dave

Thanks, going to have to sort out a TX/RX delay issue on my Flex lashup. Not sure what is going on, but I'm up in the 350 ms range, which is about 100 ms too much. I do appreciate the report.

Allow me to share my ignorance. While the TS480 is designed to use (digital) vox for digimodes, some software will also issue a software command to key the ptt line. DM780 for example. Flex is way too complicated for me.

Steve, N4AY,

We had a good connection there and you had a nice strong s9 clean signal. When you were sending your file after the 6th line we lost connection. I heard your retries but I was not responding. After it timed out I tried to reconnect with you but no success. Thanks for the QSO. I haven't been on V4 Chat in a while and it was good connecting with you. This is a great mode and I wish there was more activity.

I run V4 using my 5000 and have no problem with delay. First off, within PWSDR setup, be sure you set latency to 0. Do this in both the General tab as well as Audio/VAC tab. I run all buffers at 1024 but this is somewhat dependent upon the type of computer you are using. I'm using an I7 running Win7 Ultimate. X64. With my setup, I see anywhere from 35ms to 135ms V4 latency. If you continue to have problems send me a direct email and include your telephone number along with a good time to contact you. I'll talk you through the setup. Email address is in QRZ.

Kirk

Thanks, that was it, my latency in VAC was set to something outehr than 0. Set to 0 and fixed my issue.

Paul,
I had that problem before too!!
What kind of tuner do you have?
Do you have ferrite rings on all leads to your computer?
I changed out my old tuner , a Kenwood tapped coil, AT180 with a Palstar AT4k, I believe it cured it for me...

Leo, No ferrite beads just coil wire into air choke, the tuner is a MFJ 945E mobile tuner and the rig is a Yaesu 897D. Antenna is a end fed 24 ft long sloper. As long as I stay at 40 watts or lower nothing happens. But you know if enough is good more is better. Paul

I have Win 7 on this laptop and it works fine, I've heard Win 8 is no great gain over 7 but if your way back in Xp or something it would be good to do. I've shed alot of problems since upgrading, use to have rf reboots every few minutes , since then I replace the laptop, put ferrite rings on everything, got a new tuner so that I can get the swr down flat. It seems the tapped coil type tuners just don't get your swr down as well, just my observation.
Hope you get some more input on your idea....

I just installed V4 Chat on my new Windows 8 machine and it works fine.
I installed a program called Start8 and it looks just like Windows 7
with the start bar. When you install V4 Chat it will warn you against
installing it. Be sure to click details and then ok to install it. It
will install in the root directory so you don't have to worry about
being in a protected directory like program files.

That's an excellent point you bring up about a counterpoise for that type of antenna, right on the money. Just bet he is getting rf back into the shack, it has all the symptoms doesn't it?
My wife has a simple DXLB 160-10 dipole and it doesn't take much real estate and works great, very do-able. I have it top hat style or level , I would have liked to droop the ends for better lower angle take off but I didn't want to have any ground obstacles. Even my back guys for my tower I put up 6 feet to keep the deer from hanging themselves.

I have four guys for my tower. Two are used also for 40 meter inverted vee, and tow for 80 meter inverted vee. I used three eights inch stainless steel cable and compression insulators. Two of the guys are held up with three inch caste iron water pipe 20 feet long. I couldn't handle a 20 foot section of pipe, so I had it cut and used pipe unions. I put a 10 foot section in the ground using a water hose down the inside of the pipe. This left a hole double the diameter needed for the pipe...so I filled it with concrete. Then I fastened the other ten feet.

3052. New User Questions!

Yahoo group: V4Protocol
Date: 2013-01-13 23:14:47 UTC
From: kk4lac@rocketmail.com
Topic: 3052 Message: 3052

I have V4Chat up and running - Windows 7, SignaLink USB, into a Yaesu FT-897D. I'm excited about trying this new mode out. Tried sending and ARQ - CQ several times but didn't see a response yet. I read through the help documentation, but didn't see anything specific about operating in the mode.

I noted the posts about frequencies in the group postings. Does everyone expect most V4 traffic to be on 7.073-7.074 or 14.073-14.074 centered on 1500Hz? Are there other common V4 areas on other bands?

I notice that the V4 Chat app 1.0.4.0 is preset for 1500Hz. Is there a way through the app to adjust where you are on the waterfall as one might see in HRD or fldigi so you could find or "chase" a V4 QSO?

Are there any "nets" running on V4 so one might be able to test TX/RX? Does this mode allow you to monitor "traffic" between other stations or is it only Peer-To-Peer?

Thanks! Hope to hook up with spome of you guys to osee how this works. Especially interested in how this might be applied to ARES or Emergency Comms.

Hi Yussi,

Sorry I wasn't able to make a connect with you. I did see your connect request but your signal was light, but I did manage to wake a couple of people up :-)

Had nice qso with NR5G and W4WEB. We all were asking where all of the V4 activity was. It's really been quiet and V4 is such a fun mode to work. Thanks guys for the V4 contacts.

Hi Ron et al,

I heard/copy abt "Phid... County.." but seem condx going down.
I use only OFCD and abt 500W out.
Tomorrow QRV again, I look at VOAPROP for good time enough and send info
again via V4 msg when QRV on 20 or 10m.

3072. Registering V4 and WINMOR

Yahoo group: V4Protocol
Date: 2013-02-12 15:03:55 UTC
From: SV1UY
Topic: 3072 Message: 3072

Hi all,

I decided to register my V4CHAT and WINMOR a few days ago and upon paying the fund I immediately got a reply with long strings for both programs and indeed they registered FB.

Now the problem In V4 everytime I run the program I get a message box called "Auto Registration" and the information in this box says "An email will be sent to Register your call and Registration in the V4 Registration data base."
I get this message box everytime I run V4 chat. I have no problems with the registration of WINMOR.

Any ideas please? Do I have to tick something in the program's settings?

Oh BTW, I am calling CQ V4 right now.

73 de Demetre SV1UY

Demetre,

Try this. In your V4Chat directory you will find a file called V4 TCN.ini. Open that up with a text editor (word pad etc)
Make sure the following two lines are in there:

Registration=53394087D12CF34431EB6BFEE1234556 <<< Put the registration hex code for YOUR call sign here if not already there

Registration Email Sent=True <<<< This should stop the popup

Hi Rick,

The Registration line with the proper registration code for my callsign was there already, but not the Registration Email Sent=True line, so I just added it at the end of the file and this did the trick.

Thanks a lot.

Topic: 3075 Message: 3076

Good question, I don't know of any channels on 20 meters either. 14.073 is pretty light on v4, I hear more Oliva and Feld Hell in there but usually its just off to the side. I've even had one Oliva qso land right on top of me and still maintained my qso on V4.

Thanks Pat. I guess the band is closed because I don't hear IK3NWX or anything else.

Concerning to IARU Region 1 rules digital modes are specified from
10.140 to 10.150 kHz. Therefore 10.143 kHz would be much better and free
of any beacon or stations using cw. Pat, you'll find me @10.143 and
14.073 in V4chat mostly at weekends. But send me a mail for an
appointment if you like (et zijn 125 km tuissen onsere QTHs, ik denk dat
de 40m band optimaal wil werken. En 80m band antenna heb ik met end van
04/2013).

IARU is discussing to harmonize the 30m band in region 1, 2 and 3,
because 10 MHz allows "interregional" traffic at day and night.

Hi Chris and Alaster,

Both your emails have just popped onto my screen!!

Chris, I could hear you loud here in IO80jx and received just your name and QTH - that may still count as a QSO !! Hi Hi

I also heard you in QSO request to M1DFO / Alaster.

We can try again on 60m -later - S6/7 here.

73 to you both

Eugene and Alaster,
I got all your text Eugene before the disconnect... so a QSO!
Got a connect request from Alaster but nothing else.
Tom DF5JL heard me at abou 5 7 but couldn't come back as 5 MHz not
permitted in Germany.
I will put out a CQ at around 16:30 and see if anyone is around for a
test/QSO on 5364 kHz USB dial if clear.

Eugene,

thanks for QSO yesterday, my 1st with V4.
Conditions were starting to change for the better during the QSO, shame I had to go.
How were conditions at your end ? I get varying amount of noise, it was about S8 (in 3kHz bandwidth) The inverted L works well for TX, but noisy on RX. I have made up a loaded dipole and as soon as the WX permits will put that up.

Hi Chris,

Thanks for the info.

I was very pleased with our QSO on 5 MHz using V4Chat. I got my new NoV in January and have had a number of QSO's on 60m using PSK31, PSK63 and CW (my favourite mode).

Conditions here yesterday were not good - though I did pick up some of your QSO. As you say, conditions improved towards the end of the contact. I have been using my long wire and SG230 for years - it is only up about 6m but for some reason works very on all HF bands.

In am very interested in V4Chat - in fact, I am very interested in ALL digi-modes - and I hope we can make contact again on 60m in V4.

Topic: 3093 Message: 3093

It seems to me that the above frequency is shall we say polluted with many varities of digital modes and of course all stations pile in this small space leaving v4 in the same situation.

I myself would suggest for all v4 activity to move up frequency on 20 meters into a quiet zone such as 14.107.5 to get away from the circus of digital modes.

On 30 meters 10.143 in that area seems advisable, this would give our EUROPEAN friends a better chance to work the USA, since their frequency mode allocation is somewhat different.

Just thoughts on this mess on 20 meters.

Subject: [V4Protocol] 14.073

It seems to me that the above frequency is shall we say polluted with many varities of digital modes and of course all stations pile in this small space leaving v4 in the same situation.

I myself would suggest for all v4 activity to move up frequency on 20 meters into a quiet zone such as 14.107.5 to get away from the circus of digital modes.

On 30 meters 10.143 in that area seems advisable, this would give our EUROPEAN friends a better chance to work the USA, since their frequency mode allocation is somewhat different.

Just thoughts on this mess on 20 meters.

I finally unzipped V4 program.

I'll be parked on 7.073 and 80 m. After the Satern Net on 14.065 I'll jump over to 14.073. see who is on.

I did notice a Station call CQ on 40 m. I went to copy his call sign and V 4 crashed and I lost the call sign. That was the 1 only station I saw last night.

in a posting. 14.105 Pactor stations sit on that freq. These can guys can link into VHF and UHF Packet stations. There's Node in Colorado and the some are in Newfoundland and on the east coast.

I'm not sure how much QRM you will get with that group and V4 just my 00.02 worth.

14.1075 and 14.1065 are popular pactor frequencies. 14.1065 is the more used in this country and 14.1075 the more popular in Europe. Anyone for sharing?

Dave in Minnesota

Your radio makes the initial connection and then does not like to make any push-to-talk moves after that. Your constellation scores here are plenty high enough to move data - you are in the 50-65 range mostly here in NW Louisiana

14.107.5 is within the 14.1005-14.112 segment allocated by
the FCC for automatically controlled stations and is used
by WL2K stations. It might be better to choose a frequency
above 14.112.

We are connected there at 14.106.5 dial but there's another pactor
station there...they are everywhere.

You are probably right,not sure of a frequency, but it is a mess on 20 and tonight pactor robots everywhere up to 14114 at moment.
quiet around 14.117.50 maybe better.....
POB/K8LEN

3142. Well...what's next after I get a connect?

Yahoo group: V4Protocol
Date: 2013-03-12 00:38:37 UTC
From: kk4lac@rocketmail.com
Topic: 3142 Message: 3142

Sorry to ask a dumb question - -just trying to get things going. Sent out a CQ today and surprisingly got a response! Tried several volleys back and forth with N4WI. Received several "Connection Requests and even saw it say "Connected" at one point. Tried to send some text but we never seemed to get a "handshake" with each other. Wasn't sure what to do other than try to "chat". My text went out (transmissions occurred). But not sure he received anything. Tried both ARQ and FEC modes. Once it says connected shouldn't we be able to chat? If a call sign or connect request comes on the screen, do I need to do something to make the connection happen??

Been listening and trying the frequency list I saw in another post:
80 m: 3583 MHz USB
40 m: 7073 MHz USB
30 m: 10131 MHz USB, 10,136 MHz USB
20 m: 14073 MHz USB
17 m: 18085 MHz USB, 18,103 MHz USB
15 m: 21073 MHz USB

Also - trying to see if we can adapt this for EmComm use. Has anyone had any success doing a V4 net in FEC mode? Multiple stations copying the same transmissons?

Thanks!
Bob

You need the "queue the text" to get it into your outbound buffer. That will show up at the top of the display and you can watch it tick down as the other station acknowledges your sent text.

I am wondering the same thing. I have tried using V-4 many times in the last year. I never have figured it out and gave up. FEC was the only one I could ever get connected to anyone with but after it was connected I could not send any text. I know others have had the same trouble.

Try reading the help on ARQ and FEC operation. Click File, Help Contents, Click Typical FEC operation or Typical ARQ operation. They work a little differently.

3146. Net control using V4Chat and BELL

Yahoo group: V4Protocol
Date: 2013-03-12 12:34:53 UTC
From: la7um
Topic: 3146 Message: 3146

I am planning some easter exercice locally (maybe country wide). I want our RMS E users looking at V4Chat as well. A BELL alert sounding button might be handy.

I believe though that it must be client controllable shutting it off if operator is alert, but MUST work silent.

A handy setup might be simultanuous use of RMS E auto polling in telnet mode if inet. Auto polling in packet if available. Manual HF polling in either Winmor or Pactor for mail if the only option.

Some HF rigs perhaps give port conflicts opening V4 and RMSE at the same time? Perhaps CIV/CAT controll also might do that?

If using a SignaLink using its vox PTT controll and manual frequency controll of Rig, my IC 706 lets me listen stby V4Chat and RMS Expr Winmor HF at the same time. First come, first serve.

IF running FEC mode, no danger at all.

What about a BELL alert button?

73 Finn/LA7UM

3147. Re: [V4Protocol] Net control using V4Chat and BELL

Yahoo group: V4Protocol

From: Rick Muething
Topic: 3146 Message: 3147

Finn,

Believe it or not I actually do have other things to do than program 24 hours a day..(it already consumes 6+ hours most days!).

The conflicts of V4 and RMS Express (com ports and sound cards) are simply because you can't have two programs talking to the same hardware at the same time. That is both a Windows restriction and a logical restriction. (Just like you and your wife can't drive the same car in two directions at the same time!)

And yes a special function could be done to intercept a special character and play a bell sound when it is received. There are also things I can do to increase the speed and improve the weak signal response and increase the robustness of V4. But honestly I just don't have the time now to do this. When Vic passed away we lost a significant (and very productive) fraction of our Winlink programming team so now we all are picking up the work Vic was doing and implementing important improvements on some of the Winlink programs and systems.

Perhaps when I am on a scheduled RV trip this summer I can spend some time with V4 but not now.

73,

Rick KN6KB (author of WINMOR and V4)

Hi,

I am using the N3ZH_software to control my M710 with V4. That works fine.

Depending on the environment I may be able to help with programming,
but as I am no fan of MS only if Borland C/C++ may be used. (The only thing I have with me heading out into the pacific).

Very nice would be to have a couple of freq. and times when we have a net with v4 users.

From: ric5
Topic: 3103 Message: 3151

I'm new to the group, I'm running a Flex 1500 and FL110 amp . I run Fldigi 3.21.66 with no problems.(all modes) Also Flamp , however I cannot get V4 chat Sound Card TNC 1.0.20 to Xmit it receives fine. I tried the CQ function I see the software running CQ but it does not key the Flex ? I'm using VAC to sound card. Anyone got any setup screen shots please.

Rick,

Did you look at the V4 Chat help on the Flex radios? There have been tests using this setup that work. On V4 Chat Click: Files, Help Index, Flex SDR Radios. Follow the setup which is based on using VAC. Be sure to check your latency times...very important for ARQ operation.

Rick. Believe it, I understand the impact of the loss of Vic. My suggestion is kind of "BELLs and wistles".... Also charaterset UTF8 in due time would be handy.

But I don't understand that you can have time for doing anything else than programming. Perhaps wife is steering the car all the time so no conflict, and you are a back seat "programmer" when on the road, hihi.

Take it as mere suggestion at a time I remember it, for perhaps doing it when times comes.

Thanks I’m going to eat lunch and walk away from it for a while. I had no problems setting up VAC Xmit to my Flex but this has worked me over for while 2 hours. I may try on the old FT-102 which has my Rigblaster box for a interface. That’s my RTTY setup it runs a cool 100 + watts all day long !

See If I can get to xmit via the cable , I sure I can . Maybe I can speak with some that has set the Flex and find out where my problem is.

Thank you for your help Rick

The one-stop watering hole for arranging digital skeds is:

http://www.obriensweb.com/sked/index.php?board=digitalradio

It is in good use every day. Just post a message there, and you will be
talking V4 in a matter of minutes!

Also take a look at the 30m Band Utilization Chart to see where V4 fits
in on 30m:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

--
73
Ian, G3NRW

The 30m Band Utilization Chart:
http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

The UK 60m Band Utilization Chart:
http://homepage.ntlworld.com/wadei/UK_60m_band_utilization.htm

The 160m Band Utilization Chart:

Ric,

I don’t have any screen shots although I can make one for you. However, I think you may need to use a program that creates a virtual com port versus FLDIGI as your rig control. There are two that come to mind and either one is good. The first is Com0Com and is available via the Flex Radio knowledge base http://kc.flexradio.com/KnowledgebaseArticle50062.aspx and the other VSPmgr (which is the one I use). It’s available from Steve Nance, K5FR who has written the very fine program DDUTIL. http://k5fr.com/ddutilwiki/index.php?title=Main_Page In order to get VSPmgr you will have to make an email request Steve. Steve will be very quick to respond to your email. If you need further assistance, please email me your phone number directly and I’ll give you a call. My email is listed in QRZ.com.

Rick,

Did you look at the V4 Chat help on the Flex radios? There have been tests using this setup that work. On V4 Chat Click: Files, Help Index, Flex SDR Radios. Follow the setup which is based on using VAC. Be sure to check your latency times...very important for ARQ operation.

Subject: [V4Protocol] RE: Flex 1500 Setup via VAC ports Help!

I’m new to the group, I’m running a Flex 1500 and FL110 amp . I run Fldigi 3.21.66 with no problems.(all modes) Also Flamp , however I cannot get V4 chat Sound Card TNC 1.0.20 to Xmit it receives fine. I tried the CQ function I see the software running CQ but it does not key the Flex ? I’m using VAC to sound card. Anyone got any setup screen shots please.

Ric,

I don’t have any screen shots although I can make one for you. However, I think you may need to use a program that creates a virtual com port versus FLDIGI as your rig control. There are two that come to mind and either one is good. The first is Com0Com and is available via the Flex Radio knowledge base http://kc.flexradio.com/KnowledgebaseArticle50062.aspx and the other VSPmgr (which is the one I use). It’s available from Steve Nance, K5FR who has written the very fine program DDUTIL. http://k5fr.com/ddutilwiki/index.php?title=Main_Page In order to get VSPmgr you will have to make an email request Steve. Steve will be very quick to respond to your email. If you need further assistance, please email me your phone number directly and I’ll give you a call. My email is listed in QRZ.com.

Ric,

I run my Flex1500, 3000 and 5000 using V4 with no problem. Sounds to me like you may be having problems with Com ports. Are you using virtual com ports? I'd be happy to walk you through setting up your Flex. Probably the easiest way to do this is to give me your telephone number and I'll give you a call.

Okay Fin,

I have OFCD 80-10m but seems 10 Mhz area is oka vith ATU.
SO I'm now QRV v4 1045.5 MHz USB and calling you or CQ / intermittent
action.

CU SN!

Yussuf, so far no hear, but from Oslo to Finland is a "starting time now 1000UTC. Next hour and onwards HAMCap shows normally stronger signals.

20m on 1200UTC Seems best, but I am on 10145,5 dial.

Usually the 40m RMSs near Helsinki are good here, so 40m (or in between) probably is theoretichal usable frequencies. Not so good just now, so conds not good I think.

Tuned G5RV here.

Finn

3171. New - help using FT897 and V4Chat

Yahoo group: V4Protocol
Date: 2013-03-18 14:18:44 UTC
From: pjaway63
Topic: 3171 Message: 3171

Hi

Sorry very new to v4

I have an ft897 connected to a cat lead and minipro zlp data interface.

This works well using hrd + dm780 , psk, rtty etc.

I tried most of Sunday to get v4 working. Please if you use a ft897 could you confirm which mode and settings you use.

I was monitoring 14.073 and 7.073 - but could not pick anything up

Tried calling cq no errors but no response

Thanks

Paul

Wow, Yussuf. What super 30m 5.9 links we had, and still have even if 40m RMS Winmor close by was marginal (4.0). My turn having a walk, hi.

It is a rather rare mode, unfortunately. I like it but on a RTTY contest weekend, its even harder to find somebody to chat with.

You can try scheduling a contact here so that you can get your radio settings de-loused. I am available tonight after work (post 5 pm or so) until 6:45 and then again after 8 pm. The 6D1 MARS digital net runs from 7-8 or I would help you straight through the evening.

It does take a typing and chatting knack to get your "ready to send" data into the Outbound Queue but we can sort through that tonight.

Just name a freq and time.

I guess you maybe at work. Sitting on 14.073 is really a lost cause like
Rick Mentioned. I'm parked on 14.106.5. If anyone is interested.

Don. No hear so far. I still sit a few couple of days for some norwegian tests. Germany and Finland heard exellent. Also short local tests 40m and 60m.
80m too noisy background.

In easter a totally other drill.

Don't expect too much. G5RV and ca 40W

Hi Alex

The usual dial frequencies on 30m are 10.131 and 10.136. See the 30m
Band Utilization Chart here:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

I am calling CQ now on 10.131

That's great. Could you post a message with the frequency details on
K3UK's digital reflector:

http://www.obriensweb.com/sked/index.php?board=digitalradio

That is where many people look for digital signals.

Akex. I was away, still sitting there. Copied ur signals beautifully from a qso with another guy, Robert...after a CQ around 1930 UTC. Calling a SM5 station. We could have done a good one.

I also just before could see a M0 nice signals station calling CQ and Calling VA7DGP Don.

Ian. Thanks for your info. My sitting there is intentionally for some local norwegian tests a couple of days before a drill. Not splitting the "water holes".

Thought that someone might use the opportunity.

Later I probably will try your mentioned frequencies. And spread your info to other participants.

We also in between short tests jumped to 40m and 60m and 80m (80 did not work due to local noise, but 40 and 60 very nice.

Don. Yes. Me and Yussuf OH7TE doing very good links. Local daytime. Not now.
I still sit on this subjects freq, due to some local tests. May not be in the shack all the time. But please check qrq, just for checking link or not link. US and Canada has possibilites according to HAMCap 1.8 for the hours to come after 2300 UTC.

Locals get impressed with the mode. Something real unheard new for them.

Hi Alex

Just for the record, the 30m Band Utilization Chart is *not* a bandplan.
It is simply a record of where people mostly operate.

Yup. Getting closer to summer my guess is that Nordic countries north south some hours around local noon is very good on this band. We need higher bands for the US.

Yussy. Not that high. Max 14mhz from Oslo for VA. I heard N4 0043UTC, 10131.Max freq. This max fits HAMcap 1.8. Next top is +- 1730UTC 14073 for VA, but 10131 for OH from Oslo.
18mhz just not usable for VA from Oslo, 14mhz perhaps for VA +- 1730UTC.
10mhz good from Oslo to OH +-1700UTC.

This is general. Then there might suddenly be openings, or killing aurora.

I leave shack now 1020UTC, no answer from you on 10131. But sit on frq. May jump to 14mhz later.

Topic: 3194 Message: 3214

I downloaded the Hamcap. it said my my VOACAP was out of date. I downloaded latest and it still won't run. Anyway off topic. I was on 10.131 my 22:30 and gave a few CQ.

Last night at Delta Amateur Radio club. They were giving a talk on compromised Antenna. The speaker mentioned that he contacted Finland just before he got to the meeting.
As usual wrong band. I searching for propagation using beacon map. I can hear CW coming from Beacon stations.

So what would be the 10 m V4 freq to use??

Ian. My experience is a year or so. It fits well I would say. Other LAs working HF for a life time have tried alot of programs, but have returned to this one and recommended it for me.

Point is HAMCap 1.8 uses the ITSHFBC (the voacap part of it), just as RMS Express does. And it is working OFF LINE and is free.

AirMail also uses ITSHFBC (the ICEPAC part of it).

Just install latest itshfbc from winlink ftp site ithsfbc_120722.zip
and let it install on C: Where it suggests itself.

Then you suddenly has 3 programs benefitting from this ITSHFBC.

As you know I use RMS express already. Anyway will move Hamcap to c: as its loading up on my D: drive. That could be part of the problem

I'm parked on 28.120 FYI

I think it is itshfbc that definitely must sit directly on c: as an originally DOS program. I have RMSE , AirMail, Hamcap all in C, and itshfbc directly on c.

What frequency for you depends upon where you are , and where you want to go.

LA (Oslo) to Canada, just now with Isotropic antenna and 10w indicates 10131 or 14073, (best just now) when using default propagation parameters.

No response on 28120mhz. Silence.

You must enter your own position for vieweing general coverage on different bands on different hours (UTC) (Map window)

You must enter target position if in addition wanting to see best freq at anyone time, (the Chart) window)

I am calling on 20m just now.

I'm not at home. Nothing on 14.073 when I left. Still can't get Hamcap to work even though I've updated my VOACAP

Try when I get home later

I'm parked on 14.073 while away

Don. You may try. 10131. That is the band from LA (Oslo) to Canada for some hours and onwards from now 2300 UTC. I am ARQ, not in the shack, but you get an indication if getting a link.

40w and G5RV. Under Aurorabelt...I doubt....one needs special conds at 60deg north. :-((A big beam might have made the difference.

Hope you get the HAMCap running with the right version of itshfbc.

Had a very good link this evening on 20m to France with a first V4 link for him. He was impressed.

I've moved up from 7073 to 10131. Will call cq and see what happens. I'm not getting any bites on 40 m. PSK moving up to 7073. I could read them but no one came back when I switch to psk31.

3243. Question regarding Use of V4. What Freq to you

Yahoo group: V4Protocol
Date: 2013-04-12 02:42:30 UTC
From: truckerdon1949
Topic: 3243 Message: 3243

I'm wondering if a newbie file could be put in the file section of V4. I've reasonaly put V 4 on my PC. It's by searching the message's that I found 14.073, 7.073. I'm wondering if we could have some txt posted. Showing what freq on each band we can expect some one to be hanging on.

Later

Don

Don
Calling 10131 in a minute. 30 is the band between Oslo and Canada Now.
But dont expect too much from my G5RV and some bacground noise.
My qth is not good.

I am firing a reply Winmor to Sweden around Stockholm just now.

A pity so litte attention around V4.

But it was a big succes teaching other local hams during our Easter Winlink Drill.
V4 was a part of it.

I was thinking about you. I had not seen any comments from Finn. I sent off the email. I've been calling cq on 7.073, 10.131, and 14.073. I don't really know any other freq.
I've been helping a local ham set up RMS. I mentioned V4. I hope I can get a few more locally on the freq.

Glad to see all is ok. My next project is get the radio and the TNC running. Most important stuff working now. HF and my D star. My soundcard is just working great on Winmor.

Be nice to get chatting with V4.

73

Time to crash.

3249. Connecting to a Winmor station?

Yahoo group: V4Protocol
Date: 2013-04-14 03:55:16 UTC
From: learjetlarry
Topic: 3249 Message: 3249

I have been using Winmor for some time now. Basically, no problems. Here lately (past couple of weeks) I have been unable to connect to ANY Winmor station on ANY band/QRG. What's up? Nothing has changed with my computer and I still have the "latest and greatest" version of RMS Express. Suggestions will be much appreciated!

Thanks and 73,
de Larry

From: Rick Westerfield
Topic: 3249 Message: 3250

You are asking this question in the V4 Chat Yahoo Group but that's OK.

Can you hear any WINMOR activity? Do the RMS WINMOR stations respond to your calls?

When was the last time you updated the list of RMS WINMOR stations? You could be calling stations that are no longer in operation.

What interface do you use? If it is a Signalink, the delay must be fully, fully, fully counterclockwise.

Are your antennae resonant? RF into your system can really wreak havoc with this waveform.

Do you have any receiver or transmitter incremental tuning dialed in? You could be off frequency.

Rick,

I'm sure 20m would not work - we would simply bounce over each other's heads. Let's try 40m - 7.073 MHz dial (USB). I'll go there and call CQ.

I just very briefly made a connection with K7LRB but propagation is very unstable and QSB broke our connection before we could exchange any data.

3260. FSK CW ID

Yahoo group: V4Protocol
Date: 2013-04-27 20:11:36 UTC
From: k0og
Topic: 3260 Message: 3260

This is kind of a silly question, but more for curiosity's sake...

On the Winmor modem my ID is in CW (single-tone), yet I notice that many others are in FSK. In the V4 modem my ID is in FSK. Can I set it to CW instead? I looked in the .ini file but saw no option for that.

Joe. If using IC7200 or IC7600, or Kenw TS590, with inbuilt soundcard you get "pure CW". If using external SignaLink USB you get FSK version. 73. Finn/LA7UM

Finn, thanks for your observations.

I'm using an old but reliable Creative AudioPCI (Sound Blaster) sound card in my WinXP PC. With this same system, I get different results with Winmor than I do with V4 when issuing the Morse-code ID. I find no parameter that would control the ID behavior in the .ini files for RMS Express/Winmor nor V4.

I saw a comment that K7LRB made a to Pactor Reboot. I was given a SCS-PCT-11EX modem. I'm looking forward to use it for RMS and V4. I should be up and running Tuesday.

I'm pretty sure the SCS modem will not function on V4. However, it will work fine with any of the Pactor stations. Winmor was developed to allow hams reasonably priced access to the Winlink email system without having to purchase an SCS modem(I think now over $1,000.00 for the least expensive modem.) The modes in the SCS product are in the firmware in the box.
V4 is an off-shoot of the Winmor sound card TNC.

Wish you good luck with it, it is a very fine product.

Your PTC-IIex will not help you on V4 but you will have a lot of fun with that Pactor modem nonetheless.

RMS Express will need the PTC to have the 4.0 version of firmware to work with it but that is a simple and free upgrade from the SCS web site.

Joe. I observed on the RMS Express using Winmor, and on RMS Trimode. Did not so far check on myself on V4. We need inventor of both, Rick, chiming in.

I believe the soundcard and way of keying is part of the issue.

Joe, All,

The keying methods for WINMOR and V4 are similar. There are several possible methods.... any will work when set up correctly.

1) VOX or VOX type keying. The virtual TNC adds a longer leader to allow the transmitter VOX (or in the case of a sound activated PTT like on the SignaLink USB or similar interfaces) to key the transmitter. If using the SignaLink you MUST have the PTT output wired to the radio and you MUST keep the DLY control fully CCW. For Transmitter VOX you should have the VOX hold or delay set to minimum.

2) Using a the DTR or RTS signals of a dedicated serial port. This may have to be level shifted or go through a relay to key the transmitter.

3) On those radios that support “CAT PTT” the software will issue a PTT ON/OFF command to the software.

The Help should elaborate on these methods and how to set them up.

The acid test is to look at the T>R latency as measured when calling for a connection. No matter which method you use the latency must be < 250 ms.

73,

Rick KN6KB

Rick,

Thanks for the info. I'm using the Creative AudioPCI for audio transport, and a serial-port circuit (RTS pin with 2N2222 and a base resistor & diode) for PTT. I observe my latency to be between 30ms and 60ms when sending connection requests. What seems strange to me is that with the exact same hardware I get the two-tone ID on V4 but CW (single-tone) ID on Winmor. I have both software packages set up identically in terms of using CAT for frequency control and serial-port PTT control. I do not use CAT for PTT.

Joe,

That sounds like a bug in the V4 CWID...it is supposed to drop back to ON OFF keying (single tone) if VOX keying is not used. The only reason you need FSK keying is to keep the VOX relay from chattering. Of course it only affects the ID and both ON OFF keying and FSK CW are legal ID.

Rick,

I just did some more studying and testing, and have to conclude that there is indeed a bug in the software. When I use either CAT or serial-port PTT, it still uses the dual-tone ID.

3278. Re: [V4Protocol] Re: FSK CW ID

Yahoo group: V4Protocol
Date: 2013-04-30 23:27:52 UTC
From: Rick Muething
Topic: 3260 Message: 3278

Joe,

It may be that I just didn't enable the ON OFF keying....As I said it is a minor issue.... It is just the legal ID . Anyone running V4 can copy the ID on the screen. I Don't have the time right now to go and and work on that.

Rick KN6KB

Subject: [V4Protocol] Re: FSK CW ID

Rick,

I just did some more studying and testing, and have to conclude that there is indeed a bug in the software. When I use either CAT or serial-port PTT, it still uses the dual-tone ID.

73,

I observe my latency to be between 30ms and 60ms when sending connection requests. What seems strange to me is that with the exact same hardware I get the two-tone ID on V4 but CW (single-tone) ID on Winmor. I have both software packages set up identically in terms of using CAT for frequency control and serial-port PTT control. I do not use CAT for PTT.

Rick,

Yes, it is a minor issue - no problem putting it on the back burner to get to when it is convenient.

Thanks for your efforts with V4 and Winmor - you've brought some useful (and fun!) tools to us all.

73,
-Joe-

Don: Thanks, again.

Strange happings. I could here you , but very low and never got a copy on your signal.

Guess we have to try some other time.

I tried CQ and a Direct QRQ to your call, no joy!

Topic: 3284 Message: 3284

Rick,
thanks for the improvements to the WINMOR protocol. Just tested with RMS DB0ZAV, who is still using version 1.4.7.3. Works fine!

Is there an implementation of 32QAM into the V4 Soundcard TNC planned?

Betreff: [WINMOR] Test version 1.4.7.5 of WINMOR TNC posted on Yahoo and Winlink User FTP

All, Doing continued refinement of the 32QAM mode. This version (which should be backward compatible with both the 1.4.7.3 and earlier versions) now supports 16QAM in place of 8PSK and 32QAM in place of 16PSK. This should provide improved robustness when connecting to a similar version. I am running this new version with additional logging on my RMS Trimode and would welcome test connections. To activate these higher speed modes (in either 2 carrier or 8 carrier channels) it is necessary to have some fairly large (say 5+ k) messages to insure it tries these higher speed modulations. You should enable the WINMOR TNC debug log (On the WINMOR TNC form Help, basic setup, check Enable WM TNC debug log, Update ini) as this will capture some internal measurements of how well the 16 or 32 QAM modes are working. For those that have asked (or for anyone who really cares!) QAM means Quadrature Amplitude Modulation where both the carrier amplitude and phase are changed (as opposed to PSK (Phase Shift Keying) where only the phase is modulated. This permits sending one extra bit (two amplitude levels) per symbol and this extra FEC bit is used to improve the robustness of these higher modulation modes. You will see this as rings of symbols (inner and outer rings). If the signals are very good you can make out the individual symbol clusters (16 for 16QAM, 32 for 32QAM) but most of the time they are so smeared (by propagation) that they look more like fuzzy concentric rings. The FEC bits help ?recover? these smeared symbols to yield good decoding. I have posted 1.4.7.5 on both the WINMOR Yahoo group and the Winlink WINMOR TNC FTP ftp://autoupdate.winlink.org/WINMOR%20TNC/ 73, Rick Muething, KN6KB

Jakob,

Well I hadn't thought about it much...I'm pretty swamped. But it would be possible to build something like this:

Replace the 4FSK modulation in V4 with 8QAM. The current 4FSK carries one FEC bit and one user bit per symbol. 8QAM could carry 3 bits/symbol would be used something like:
1 user bit per symbol (46.875 baud give about 100 Hz of bandwidth and about 351 bytes/minute or about 58 words/min (probably closer to 45 WPM after ARQ overhead). That is fast enough for manual typing. The signal would be about 50% wider than PSK31

2 FEC bits per symbol one being the Viterbi Trellis code and one being the layered Reed Solomon. That should be very robust in all but the worst extreme multipath propagation. Layering two codes is very productive as they complement each other (Viterbi is near optimum for random errors but not good for bursts. Reed Solomon is excellent for bursts)

I may have some time this summer to play with that while I am on our RV trip out west to Wyoming for 2 months.

Your comments welcome.

Rick, KN6KB

Rick. How robust would this be compared to MFSK16 used as ARQ? And what about UTF8 ?. I am searcing for a commom denomintator for Aurora net control.

4PSK changed to 8QAM in WINMOR seem the next step regardless of BW modes.

THEN rethink about when gearing from one BW to another in WINMOR.

For QSO SPEED, it seems for me that the most robust mode possible at any given time seems of interest.

After sun burst last day it was mandatory staying LOW in frequency, and in addition forget about all wide bands. Stick to 500Hz BW for making the tests in new WINMOR regardless of distance to my local server.

This version (which should be backward compatible with both the 1.4.7.3 and earlier versions) now supports 16QAM in place of 8PSK and 32QAM in place of 16PSK. This should provide improved robustness when connecting to a similar version. I am running this new version with additional logging on my RMS Trimode and would welcome test connections. To activate these higher speed modes (in either 2 carrier or 8 carrier channels) it is necessary to have some fairly large (say 5+ k) messages to insure it tries these higher speed modulations. You should enable the WINMOR TNC debug log (On the WINMOR TNC form Help, basic setup, check Enable WM TNC debug log, Update ini) as this will capture some internal measurements of how well the 16 or 32 QAM modes are working.
>
> For those that have asked (or for anyone who really cares!) QAM means Quadrature Amplitude Modulation where

both the carrier amplitude and phase are changed (as opposed to PSK (Phase Shift Keying) where only the phase is modulated. This permits sending one extra bit (two amplitude levels) per symbol and this extra FEC bit is used to improve the robustness of these higher modulation modes. You will see this as rings of symbols (inner and outer rings). If the signals are very good you can make out the individual symbol clusters (16 for 16QAM, 32 for 32QAM) but most of the time they are so smeared (by propagation) that they look more like fuzzy concentric rings. The FEC bits help ?recover? these smeared symbols to yield good decoding.

Finn,

There is less to be gained by using QAM8 on the 4PSK mode. There is already pretty heavy FEC. (code rate = 1/2) before RS. Though it probably won't be too hard to test it. First I have to find the bug in the QAM16 implementation....it works but it is not correcting as it should!

Re MFSK16. You have to decide what do you want. If you want the absolute robustness you use wide band, very high redundancy and maximum power. MFSK16 takes up a lot of room for its throughput but it is robust because of all the redundancy. But a narrower mode like QAM8 that is carrying say 2 FEC bits/data bit (code rate = 1/3) can be very robust since it puts all the power in a smaller bandwidth (higher S/N). The biggest problem with the QAM modes will come with very strong multipath though lower baud rates help this.

I would like to include UTF8 capability (pure binary) in a mode but it does slow down the text (8 or 16 data bits vs. 7 for ASCII).

Rick

Rick. My issue at the time being is being asked to line up or advice NRRL related to a national digital addendum to a Voice ned. FSK modes seems the Winner.

1: I have been, and contine to promote Winlink, also in cooperation with Sweden and other Norwegians.

But for ONE to many: Call it NET CONTROL, I have by pure luck been informed about Voice of Americas ongoing weekend tests of digital text and picture using a 50 year old AM transmitter in North Carolina.

http://voaradiogram.net/

So downloading FLDIGI, FLMSG, FLAMP, MMSSTV, and EasyPal (DRM Based pictures) I have had a hard time learning new stuff. My signaLink does the job.

It has been my only opportunity trying that SW.

They introduced UTF8, (double characters tranferred for the special characters only as I understand it) amongst others choosable as well.

Since it is only 3 extra norwegian, swedish, and some german characters and most of the alphabet is standard ascii, it doesn't seem adding much overhead. Each of them has double charachters transferred.
Accents tested in Spanish and French. Working very well indeed.

Greek or Cyrillic alphabet might be another task.

Main learning has been that MFSK 16 is the mode banging through every type of noise and weak signals, about 350Hz, (within a 500Hz channel). This happens when voice is unreadable They have tested every thinkable mode and speed Including Olivia and Thor and a lot of others. MFSK 16 beats them all.

(FM and local transmissions is another issue).

This off course is broadcast, but that is what we need when voice controll of a net does not get through, and can work on 30m where we cannot talk.
Perhaps HAMS on USB can use this.

SW works on Linux, MAC and PC, so everybody can participate.
Then run their WINLINK Mails as they like. RMS EX PC +NEWMACs/Parallel
AirMAil Linux/Wine and Older MACs/Parallel.

At the time being my recommendeation has been Pactor 2 Fec or arq in some time slots, V4Chat in other time slots, and Leader stations MUST be able running both but in different time slots.

Perhaps MFSK16 might be a better solution for coordinating networks having broader time slots using it all the time. The experience from VOA has been impressive.

Then nobody is excluded for getting directions.

In other main or standard time slots they ALL shall do Winlink mail in every free possible way.

FSK modulation stands out. Good for Aurora (or least bad).
This is very clear in WINMOR as well.

People get surprised when I get them (one by one) to try V4Chat, how well it works. But they miss the few 8bit characters.

UTF8 as recently solved in FLDIGI makes MFSK16 a joyful pleasure typing QSO or manual info between EU countries.
Not slick, but bunches of FEC and redundancy.

Well. Just some night thoughts before the RV tour.

Hi Finn,

I am very interested in your statement that you find that V4 Chat works well. My experiences over the last couple of years (and various versions of the software) is that it does not work reliably in an ARQ environment.
I have tried with various computers, interfaces and radios working with different powers/frequencies/distances/propagation conditions... the ARQ session can nearly always be established eventually. However, on the second turn around (regardless which station initiated the call) the session always times out. I once managed a QSO (2000km) which went to three turn arounds before timing-out, however we were using different versons of V4, so that could be the reason.
I spent a couple of weeks doing a detailed analysis when working locally (3 km path, 59+ signal on 20 meters) using the debug logs of both stations. In all cases the latency of both stations is between 40 - 70 mS and they use the same version of the software. My conclusion was that there is a timing issue in the software. I asked Rick for help, and he told me that it was essential to be totally familiar with the details of the program in order to understand the problem. He suggested I send a dump of the logs to him and he would look at them when he had some time. I have asked about progress, but I understand that V4 is very low on Rick's priorities list!
How have you configured your system so that you can demonstrate that it does work well?

Subject: [V4Protocol] Re: [WINMOR] Test version 1.4.7.5 of WINMOR TNC posted on Yahoo and Winlink User FTP

Rick. My issue at the time being is being asked to line up or advice NRRL related to a national digital addendum to a Voice ned. FSK modes seems the Winner.

1: I have been, and contine to promote Winlink, also in cooperation with Sweden and other Norwegians.

But for ONE to many: Call it NET CONTROL, I have by pure luck been informed about Voice of Americas ongoing weekend tests of digital text and picture using a 50 year old AM transmitter in North Carolina.

http://voaradiogram.net/

So downloading FLDIGI, FLMSG, FLAMP, MMSSTV, and EasyPal (DRM Based pictures) I have had a hard time learning new stuff. My signaLink does the job.

It has been my only opportunity trying that SW.

They introduced UTF8, (double characters tranferred for the special characters only as I understand it) amongst others choosable as well.

Since it is only 3 extra norwegian, swedish, and some german characters and most of the alphabet is standard ascii, it doesn't seem adding much overhead. Each of them has double charachters transferred.

Accents tested in Spanish and French. Working very well indeed.

Greek or Cyrillic alphabet might be another task.

Main learning has been that MFSK 16 is the mode banging through every type of noise and weak signals, about 350Hz, (within a 500Hz channel). This happens when voice is unreadable

They have tested every thinkable mode and speed Including Olivia and Thor and a lot of others. MFSK 16 beats them all.

(FM and local transmissions is another issue).

This off course is broadcast, but that is what we need when voice controll of a net does not get through, and can work on 30m where we cannot talk.

Perhaps HAMS on USB can use this.

SW works on Linux, MAC and PC, so everybody can participate.

Then run their WINLINK Mails as they like. RMS EX PC +NEWMACs/Parallel

AirMAil Linux/Wine and Older MACs/Parallel.

At the time being my recommendeation has been Pactor 2 Fec or arq in some time slots, V4Chat in other time slots, and Leader stations MUST be able running both but in different time slots.

Perhaps MFSK16 might be a better solution for coordinating networks having broader time slots using it all the time. The experience from VOA has been impressive.

Then nobody is excluded for getting directions.

In other main or standard time slots they ALL shall do Winlink mail in every free possible way.

FSK modulation stands out. Good for Aurora (or least bad).

This is very clear in WINMOR as well.

People get surprised when I get them (one by one) to try V4Chat, how well it works. But they miss the few 8bit characters.

UTF8 as recently solved in FLDIGI makes MFSK16 a joyful pleasure typing QSO or manual info between EU countries.

Not slick, but bunches of FEC and redundancy.

Well. Just some night thoughts before the RV tour.

My experience with V4 has been completely different though I find it to be sensitive to RF in the shack. Once I put up a few more resonant dipole antennae, things got a lot more dependable. I can say the same about RMS Express - better antenna, better connections.

Robin. RFI is destructive. Balanced antenna, and less is more...

Else: Main error for timeouts is clients not moving what they type into tx-buffer, or messing too much within.

Let them hook for <CR or Double Space> as a means of moving data to transfer. The Double Space is genious for forcing text into TX buffer without changin line.

I removed the: Enable Full Duplex on FEC.
Did not understand that to work.

I use ARQ timeout (seconds) 180.

Do NOT use the first option Ctrl CR for moving letters into tx buffer.
It is a killer. The session is idling indefinitely when the operators does not know how and why it works.
It MAY be elegant since you can "post edit" back several lines since they are not ready for TX, but you waste link time.

I have had successful QSOs across the atlantic from Norway to Canada.

My gear: G5RV, IC706 original, SignaLink USB. Nothing special.

The MODE IS good. Is worth further polishing.
For pure broadcast MFSK16 may be better than V4Chat FEC, but you don't have any ARQ in MFSK16, and it would not be so "slick" or quick in turnovers.

When Skipping the CAT RIG control I can have RMS E/WINMOR, V4Chat and FLDIGI running in parallel. No portconflicts.
When getting a link or session I just shut down the other programs for freeing memory.

From Oslo to UK, Italy, Germany, Austria

From Oslo 60 deg north to Finmark top of Norway 70 deg north. And to Finland.

Locally 6 km in noisy 80m surroundings.

The last one was across Norway to Bergen to a retired Military HF guy having been through it all from RTTY to AMTOR, and Pactor 2 and 3.

He was amazed when I talked him into what to do and we did the qso.

Just like old Amtor, only without errors......well errors whenever he used the three norwegian letter. It always comes two completely other pr each letter.

So ALL Europeens have "trouble", or must write like old AMTOR / RTTY limited characters/letters.

UTF8 is the EU Standard, and is highly wished. Ascii is "stone age".

Thanks for the hints, Finn.

My antennas are resonant (at transmit frequency) dipoles with baluns.
Antennas are situated 50 meters from the shack.
All audio cables have RF toroid suppressors.
So, I don't think I have RF interference.
The problem is once the ARQ session is established and after the first data exchange, both stations get locked in Rx mode (a disallowed state).
You cannot get data from the Tx buffer of either station then. No matter what code(s) for a data move you choose (I tried them all!).
After which you will get a session timeout (I also chose 180 seconds).
I (and my partners) are all using the same release of the software V4Chat 1.0.4.0 with SW TNC 1.0.2.0

I agree V4Chat should be a good mode (theoretically) but there must be a timing bug somewhere.
At least the problem is reproducible, so I am expecting the software author should be able to find it
with the session debug dumps I sent him last year.

Robin,

I am the author but I have a lot on my plate. I just spent several months working on the WINMOR TNC (which I also authored) and the RMS Trimode server and just don't have enough hours in the day to put in any more right now.

There really shouldn't be any timing bugs if the latency measurements at each end are within spec. But analyzing the timing takes the following.

The V4TNC Debug logs must be enabled at each end...not just one end. A clean capture of the session needs to be made. And then I would need probably 3 –4 days of detailed analysis to get a handle on IF there is a problem and what it might be. Time Right now I don't have. There is a lot of effort that has to go into develping a protocol and coding it. For example the WINMOR protocol probably has close to 3 man-years effort at this time. V4 maybe half of that (some of WINMOR is included in V4).

I wish I had more time on this stuff but I don't.

Hi Rick,

I do appreciate your situation, and the priority you give to supporting other software.

When I tried V4, I did everything as you suggested and recorded the session using the Debug logs at both stations.
The stations' clocks had to be sychronised to within 1 second (or better) in order to see exactly what was happening
when comparing the logs. I then spent about two weeks examining the logs, but without the fine details of your software
design and specifications, it proved impossible to discover how the process got locked up, and even worse,
why there was no apparent recovery path except by session time out.
While being prepared to assist in any way I can, I am a system designer and not a computer programmer,
so have to leave it to you.
I do follow activities on the V4 Protocol reflector, and was pleased to see now that some users have had success
working with this mode. This led me to wonder how they implemented V4... possibly a different version is now available?

3302. New experimental mode HAM4 and Chat host program for robust keyboard mode..

Yahoo group: V4Protocol
Date: 2013-07-10 18:37:25 UTC
From: kn6kb
Topic: 3302 Message: 3302

Initial Alpha release of Chat 0.1.0.1
Chat and its' companion virtual TNC H4FSK TNC are designed for keyboard operation over HF. This is alpha code .not well tested or documented yet but appears to be functional. If you are not an experimenter or get frustrated debugging software please wait a few weeks at least until the basic bugs have been worked out.
Chat and the H4FSK TNC are an outgrowth of the V4 Chat and V4 Protocol released in 2010. I hope this (after initial debugging) will eliminate some of the limitations of V4 and prove to be a reliable keyboard FEC and ARQ mode. Here are the basic features and goals of the program and the Protocol:
The protocol is called HAM4 short for HAMming Encoded 4 FSK. It uses the same modulation type as V4 (4FSK @ 46.875 baud) and the same bandwidth (200 Hz at -26 dB. However there are several changes that should make the HAM4 Protocol better especially for keyboard operations.
1) Lower latency. The HAM4 FEC is included in each character (currently using a Hamming 11, 4 code shortened to 8,4 with a minimum distance of 3). A character consists of 6 4FSK symbols (12 bits) of which 8 are user or code bits. A character time is 128 ms. This translates to a very small latency in the range of 300 ms (the delay from sending the text from the keyboard until it prints to the remote stations screen). This is even lower than modes like PSK-31.
2) Strong FEC. The shortened 8,4 code is soft decoded using a lookup table mechanism that computes the distance to the "closest" character. This gives approximately 2 dB additional coding gain (equivalent of increasing the power by about 60%). The soft decoding also allows plotting the received signal quality as each character is received. The soft block encoding on a character by character basis reduces sensitivity to burst errors.
3) Full support for ASCII(7bit), extended ASCII(Latin-1), and UTF-8 (Unicode) character sets. This allows full support for most common languages and symbols.
4) Fast and continuous tuning and sync tracking. The sync character (also 128 ms) is sent every 1.024 seconds. This non printing character allows fast and accurate DSP tuning to about .5 Hz accuracy and tracking of drifting or off frequency signals. Loss of sync can usually be recovered in 1 to 2 seconds.
5) Good FEC and ARQ (Future) throughput. Nominal FEC throughput is approximately 6.8 eight bit characters per second or 68 words per minute.
6) Future full binary ARQ capability with approximately 250 bytes/minute ARQ rate.
If you are familiar with V4 Chat and the V4 protocol this should be easy to pick up. There is basic help but it needs refinement and expansion. Your feedback and comments are appreciated. Good luck and enjoy.

Thanks for improving the V4-Chat protocol, Rick.
I've forwarded the new file to some EmComm and digital modes interested hams in Germany. As we did before, when V4Chat was released, we'll test and compare the new protocol with the old on. Expect some Bug reports and suggestion for improvements soon.

Betreff: [V4Protocol] New experimental mode HAM4 and Chat host program for robust keyboard mode..

  Initial Alpha release of Chat 0.1.0.1
Chat and its' companion virtual TNC H4FSK TNC are designed for keyboard operation over HF. This is alpha code ….not well tested or documented yet but appears to be functional. If you are not an experimenter or get frustrated debugging software please wait a few weeks at least until the basic bugs have been worked out.
Chat and the H4FSK TNC are an outgrowth of the V4 Chat and V4 Protocol released in 2010. I hope this (after initial debugging) will eliminate some of the limitations of V4 and prove to be a reliable keyboard FEC and ARQ mode. Here are the basic features and goals of the program and the Protocol:
The protocol is called HAM4 short for HAMming Encoded 4 FSK. It uses the same modulation type as V4 (4FSK @ 46.875 baud) and the same bandwidth (200 Hz at -26 dB. However there are several changes that should make the HAM4 Protocol better especially for keyboard operations.
1) Lower latency. The HAM4 FEC is included in each character (currently using a Hamming 11, 4 code shortened to 8,4 with a minimum distance of 3). A character consists of 6 4FSK symbols (12 bits) of which 8 are user or code bits. A character time is 128 ms. This translates to a very small latency in the range of 300 ms (the delay from sending the text from the keyboard until it prints to the remote stations screen). This is even lower than modes like PSK-31.
2) Strong FEC. The shortened 8,4 code is soft decoded using a lookup table mechanism that computes the distance to the "closest" character. This gives approximately 2 dB additional coding gain (equivalent of increasing the power by about 60%). The soft decoding also allows plotting the received signal quality as each character is received. The soft block encoding on a character by character basis reduces sensitivity to burst errors.
3) Full support for ASCII(7bit), extended ASCII(Latin-1), and UTF-8 (Unicode) character sets. This allows full support for most common languages and symbols.

4) Fast and continuous tuning and sync tracking. The sync character (also 128 ms) is sent every 1.024 seconds. This non printing character allows fast and accurate DSP tuning to about .5 Hz accuracy and tracking of drifting or off frequency signals. Loss of sync can usually be recovered in 1 to 2 seconds.
5) Good FEC and ARQ (Future) throughput. Nominal FEC throughput is approximately 6.8 eight bit characters per second or 68 words per minute.
6) Future full binary ARQ capability with approximately 250 bytes/minute ARQ rate.
If you are familiar with V4 Chat and the V4 protocol this should be easy to pick up. There is basic help but it needs refinement and expansion. Your feedback and comments are appreciated. Good luck and enjoy.

Is to my understanding the H4 ARQ does not work? You can only run FEC FD mode only? Because that’s the only mode I can grt to work in this new release? If I try to call CQ or put in a call into H4 ARQ It’s just sets there and does nothing?

Hi Rick,

I heard your CW id and saw a couple of CQ's but no call sign. I did send text out in FEC mode. Rick said there was a bug so maybe it's not quite working yet.

Rick,

I think there is a sever bug in the H4FSK TNC that I uncovered last night…I may not be able to get to it today.

When all else fails ….read the help! Even though the Chat and H4FSK TNC help is currently "skinny" it clearly states that the ARQ mode is not implemented yet. I want to get the bugs flushed out of the basic protocol first before adding ARQ (just as I did in V4). FEC and FEC FD are the same it is just if you truly want to run Full duplex you have to have a receiver that is receiving WHILE you are transmitting otherwise even though the sound card is sampling while you are transmitting it is not going to receive any audio….Full duplex is not practical on HF unless cross banding. Can be done on VHF/UHF with the right equipment.

I think the bug is something I introduced into the sync logic …pretty serious…but fixable ….just a matter of time, skill and programming as we say!

73,

Rick KN6KB

> Chat and the H4FSK TNC are an outgrowth of the V4 Chat and V4 Protocol released in 2010. I hope this (after initial debugging) will eliminate some of the limitations of V4 and prove to be a reliable keyboard FEC and ARQ mode. Here are the basic features and goals of the program and the Protocol:
> The protocol is called HAM4 short for HAMming Encoded 4 FSK. It uses the same modulation type as V4 (4FSK @ 46.875 baud) and the same bandwidth (200 Hz at -26 dB. However there are several changes that should make the HAM4 Protocol better especially for keyboard operations.
> 1) Lower latency. The HAM4 FEC is included in each character (currently using a Hamming 11, 4 code shortened to 8,4 with a minimum distance of 3). A character consists of 6 4FSK symbols (12 bits) of which 8 are user or code bits. A character time is 128 ms. This translates to a very small latency in the range of 300 ms (the delay from sending the text

from the keyboard until it prints to the remote stations screen). This is even lower than modes like PSK-31.
> 2) Strong FEC. The shortened 8,4 code is soft decoded using a lookup table mechanism that computes the distance to the "closest" character. This gives approximately 2 dB additional coding gain (equivalent of increasing the power by about 60%). The soft decoding also allows plotting the received signal quality as each character is received. The soft block encoding on a character by character basis reduces sensitivity to burst errors.
> 3) Full support for ASCII(7bit), extended ASCII(Latin-1), and UTF-8 (Unicode) character sets. This allows full support for most common languages and symbols.
> 4) Fast and continuous tuning and sync tracking. The sync character (also 128 ms) is sent every 1.024 seconds. This non printing character allows fast and accurate DSP tuning to about .5 Hz accuracy and tracking of drifting or off frequency signals. Loss of sync can usually be recovered in 1 to 2 seconds.
> 5) Good FEC and ARQ (Future) throughput. Nominal FEC throughput is approximately 6.8 eight bit characters per second or 68 words per minute.
> 6) Future full binary ARQ capability with approximately 250 bytes/minute ARQ rate.
> If you are familiar with V4 Chat and the V4 protocol this should be easy to pick up. There is basic help but it needs refinement and expansion. Your feedback and comments are appreciated. Good luck and enjoy.

Rick,

Thanks for the QSO with the old V4Chat. It seems strange calling it the old program since it is not that old :-)

I didn't hear anyone else on the frequency so I guess the band isn't open yet for DX. The new chat program sounds exciting and I can't wait to give it a try. Good work on Rick's part and a pleasant surprise to get the news on the new program.

Ron,

Nice QSO on V4 chat enjoyed that a lot. Yes you right the V4 software by no means Is old . Should I say the earlier version how's that. Yes Rick is doing a wonderful job. I don't see how he does it all myself. My hats off to his hard work !

Yes hope to work you again soon, and If you like before the summer E SKIP season is gone I would like to wk you ,or someone on V4 Chat on the 6 meter band.

We will keep our eyes out for any updates on the H4 ARQ debugging and hope to wk you on it down the waterfall…..

> Chat and the H4FSK TNC are an outgrowth of the V4 Chat and V4 Protocol released in 2010. I hope this (after initial debugging) will eliminate some of the limitations of V4 and prove to be a reliable keyboard FEC and ARQ mode. Here are the basic features and goals of the program and the Protocol:
> The protocol is called HAM4 short for HAMming Encoded 4 FSK. It uses the same modulation type as V4 (4FSK @ 46.875 baud) and the same bandwidth (200 Hz at -26 dB. However there are several changes that should make the HAM4 Protocol better especially for keyboard operations.
> 1) Lower latency. The HAM4 FEC is included in each character (currently using a Hamming 11, 4 code shortened to 8,4 with a minimum distance of 3). A character consists of 6 4FSK symbols (12 bits) of which 8 are user or code bits. A character time is 128 ms. This translates to a very small latency in the range of 300 ms (the delay from sending the text from the keyboard until it prints to the remote stations screen). This is even lower than modes like PSK-31.
> 2) Strong FEC. The shortened 8,4 code is soft decoded using a lookup table mechanism that computes the distance to the "closest" character. This gives approximately 2 dB additional coding gain (equivalent of increasing the power by about 60%). The soft decoding also allows plotting the received signal quality as each character is received. The soft block encoding on a character by character basis reduces sensitivity to burst errors.
> 3) Full support for ASCII(7bit), extended ASCII(Latin-1), and UTF-8 (Unicode) character sets. This allows full support for most common languages and symbols.
> 4) Fast and continuous tuning and sync tracking. The sync character (also 128 ms) is sent every 1.024 seconds. This non printing character allows fast and accurate DSP tuning to about .5 Hz accuracy and tracking of drifting or off frequency signals. Loss of sync can usually be recovered in 1 to 2 seconds.
> 5) Good FEC and ARQ (Future) throughput. Nominal FEC throughput is approximately 6.8 eight bit characters per second or 68 words per minute.

> 6) Future full binary ARQ capability with approximately 250 bytes/minute ARQ rate.
> If you are familiar with V4 Chat and the V4 protocol this should be easy to pick up. There is basic help but it needs refinement and expansion. Your feedback and comments are appreciated. Good luck and enjoy.

3323. RE: [V4Protocol] Re: New experimental mode HAM4 and Chat host program for robust keyboard mode..

Yahoo group: V4Protocol
Date: 2013-07-11 16:08:42 UTC
From: Rick Muething
Topic: 3302 Message: 3323
Attachments: 2 described; binary payloads are missing from this source WARC

Re Chat and the new H4FSK TNC:

If you use the default character set of ASCII(Latin-1) it will work for everything except the multi byte characters of UTF-8. ASCII(7bit) is a sub set (the first 128 characters) of ASCI(Latin-1) but will also work for any all English messages.

There is a bug in the sync algorithm I will have to hunt down.

Yussi, All,

I think there is a major bug when I built the last Chat and H4FSK TNC run…I will try and look at it today and tomorrow.

Hello,

Have been testing with oh7te on 80m but only managed to copy some random parts of words. The capture window stays at TUNE even with good signal unless I turn squelch to 1..2 but then copy garbage letters.
What is the normal function of capture window and what is TUNE for?

3328. Set up and operation

Yahoo group: V4Protocol
Date: 2013-08-18 18:45:19 UTC
From: Okiguy
Topic: 3328 Message: 3328

I'm a newbie, however have been doing WSJT-X, JT9 and some attempts at meteor scatter recently. When I set up V4Chat, it halted with an error that it could not find the V4CHATSETUP.MSI file. The unzipped files did include V4CHATSE.MSI, so I renamed it V4CHATSETUP.MSI and reran the setup and it worked fine. Still sorting out parameters but it does show the waterfall and seems to transmit a CQ.

Next question, after reading the word doc and the power point, I don't see any expected frequencies for operation. Are there suggested frequencies that folks are using?

Thanks in advance.

Bill, W4WNT

28073

24973

21073

10131

14073

18073

7045

....

These are the frequencies that I know

Fill that in in the left side of the chat window (in the khz row) ...

When you have set your cat (if you have a rig with cat available) to the
correct settings it should be possible to change frequencies with clicking
on the list

But for first tests that is not needed

Sure you also found out how to set ptt?!?

In the settings window you also can control the "drive" level of the soft
(how much power is sent)

Here I have set that to 75 percent ... and control the rest from the windows
mixer (try out what works best for you)

From: Don Poaps
Topic: 43 Message: 3334

Copied the File to the V4Chat folder...I guess we meet on 14073 etc..

It's seem to work now...

3335. H4TNC virtual TNC 1.0.2 zip uploaded to files directory.

Yahoo group: V4Protocol
Date: 2013-08-27 17:39:13 UTC
From: kn6kb
Topic: 3335 Message: 3335

On the original H4TNC which I uploaded hastily July 10 I found several serious bugs. I have been on the road the past 6 weeks and did some updates and build a simple White Gaussian Noise channel simulator into the H4TNC for testing (I don't have my HF channel simulator with me here in the RV!)

I believe this version is considerably better but I had to make some changes that are NOT compatible (different character coding) than the original 1.0.1 H4TNC version.

Feel free to download the 1.0.2 H4TNC version and play with it. BOTH ends must use this new version. If you can run a full duplex test setup (where the sound card can capture at the same time it is playing) you can use the new test options in the Test drop down menu to send a Quick Brown Fox test mixed with White Noise at -10, -5, 0, 5, and 10 dB S/N (standard 3 KHz Noise Bandwidth). Try squelch values between 3 and 6. Typically 4 or 5 should work best.

When I get back (about 2 weeks) I'll be able to do more extended testing and make some new updates. I also will start work on a ARQ version of the H4 TNC.

Summary of the differences and similarities between H4TNC and V4TNC.

1) Both use same 4FSK modulation at 46.875 baud (200 Hz bandwidth)
2) H4TNC uses lower latency hamming encoding (11,4 code shortened to 8,4 with a minimum Hamming "distance" of 3. V4 uses Viterbi encoding.
3) H4 sends a sync symbol every 1 sec (every 8 characters) to allow rapid resync.
4) Both use soft decoding.

Have fun...good luck. I may try to setup for some test QSOs on the way back. (had some trouble with my tuner earlier).

This is early alpha software...if you need bulletproof and fully verified code ....best to wait a while!!!

73,

Rick Muething, KN6KB

H4FSK TNC Revision History

Date: Rev Change Summary

Aug 21, 2013 0.1.0.2 Modify Two tone command.
Change Character encoding from 8,4,4 extended hamming to expand hamming distance slightly
Modify H4Demod.Decode8BitCharacter to pass EOT (value = 4) to TNC's character crawler
Modify SearchForTwoTone to H4Demod.SearchForTwoTone62B3.
Modify H4Demod.TrackTwoTone62B
Add mechanism in basic setup to select tuning range (+/- 50Hz to +/- 150 Hz)
Add simple White noise channel simulation to do loopback test on Quick Brown fox at -10, -5, 0, 5, 10 dB S/N

July 10, 2013 0.1.0.1 Initial Alpha release FEC only

3336. Re: [V4Protocol] New file uploaded to V4Protocol

Yahoo group: V4Protocol

Don,

Did you install the Chat (not the V4Chat)? The H4TNC is a helper program and requires that you first install Chat. Then copy the latest H4TNC patch (1.0.2) into the Chat directory replacing the 1.0.1 version of the H4TNC. It works here as tested and your error message implies you don’t have the dll s installed in your Chat directory.

Just saw your latest post....THIS IS NOT AN UPDATE TO THE V4TNC or V4Chat. H4 and the H4TNC are a DIFFERENT protocol and should be installed in different directories.

The H4TNC and CHAT are different and will not work with V4CHAT or replace the V4TNC.

The goal here is to evaluate this new protocol which I believe will eventually be better and have lower latency than V4. Currently only the FEC version is on the FTP site. When calling we can still use the “watering hole frequencies” but the signal (though it sounds similar) cannot be copied by the other TNC type.

73,

Rick KN6KB

All,

As I have said the H4FEC is the only mode running. There is no H4ARQ at the moment. If you need to send a CQ or other FEC message you will have to create a text file and send that file via H4FEC.

What I am trying to test at this early alpha stage is the ability to send and receive basic FEC data on the H4 protocol. You can also use the built in test functions on the H4TNC TNC Test dropdown (e.g. Quick Brown Fox test etc)

Use the latest version of the H4TNC 1.0.2.

Hello Pat and Yusssi thanks QSO in H4FEC but seems this mode is complicate for Chat text is not send during the transmission.
The Call is not integrate in the answer.
The time to type text in same time that it is sent is too short and we don't know if we are conected.
I missed some think,
Michel

Hello all
QRV 14.073 H4FEC Chat V4 mode

Heard the 28/08/2013 AA1CZ
but in V4Tchat ARQ protocol just connection without echange more
QSB

Today QRV H4FEC conditions seems good come one please

Michel

Thanks Rick,

The new version seems to work OK on FEC.
Just had a Chat with OH7TE on 80m and also Scandinavian characters working OK. So good progress made, waiting for ARQ

Salut Eric
Attention il n'y a que le mode H4FEC qui fonctionne en ARQ n'est pas disponible sur la version Chat experimentale
Donc il vous faut taper les textes au clavier pour envoyer soit commande<< enter>> tout depend de votre configuration dans le setup

> cannot be copied by the other TNC type.

Would it be possible to make one softwarew that can be switched between
these modes?!?

Then comparing would be easier ... faste switch between modes and see what
works best ... (no need for that soft to copy BOTH modes together ... but
would be a nice add on)

Sigi,

Yes that is possible...you can do a lot in software but it would be a much more complex Chat program and I'm not sure it is worth the effort. When I get back I'll look into it but it may be better to put in a mechansim to send the same FEC file on V4 and H4 and simply measure the errors. I can easily do that when I have access to my HF channel simulator again.

Rick,

What about comparing BER between the two? You may have noticed David Rowe added a BER indicator in FreeDV. Between that and SNR estimation, the performance of its modem can be evaluated by the user.

3363. New Full install 0.1.1.0 for Chat and the H4TNC uploaded to Yahoo FTP and Winlink FTP

Yahoo group: V4Protocol
Date: 2013-10-02 16:05:54 UTC
From: Rick Muething
Topic: 3363 Message: 3363

All,

I have posted a new version (now with significantly more testing!!!) of the Chat program and the H4TNC (Implements the new HAM4 Protocol). This is available for download from the Yahoo V4Protocol group FTP or the Winlink user FTP ftp://autoupdate.winlink.org/User%20Programs/

The new Chat program and H4TNC does NOT replace the prior V4Chat. It is a new program that uses a new (hopefully more robust with lower latency) modulation and coding scheme. The current version 0.1.1.0 is considered alpha code but appears very functional. Only the FEC (broadcast) protocol is included initially .later ARQ. If this proves to be robust and effective I plan to use it to replace the older V4 TNC. I may make a future version of Chat that would support both protocols but this is not in the current plans.

The new Chat also contains a limited beacon mode to help with initial testing. I have placed a HAM4 beacon "HAM4 Test Beacon de KN6KB [EL98pf] that will be sent approximately every 10 minutes on 10.110.0 USB DIAL. If you download and install the Chat program from above and set it up (help is included and updated). You should be able to hear/copy the beacon. You can also answer me with a reply if desired. I will be here most of the day but in and out. If you set up your own beacon please try and use this same frequency or frequency on another band. Please try and co ordinate beacon frequencies and use them sparingly. We don't want to create an beacon interference.

My initial tests with the new coding scheme used in version 0.1.1.0 are very encouraging. I think the ARQ version will be equally good with higher robustness and easier operation. This new mode has very low latency (about 300 ms .faster than PSK31.)

I am having some problem with the autoupdate mechanism so this will require a full install (and uninstall of a previous version of Chat). Note: this is installed in a separate directory and shares no data with the earlier V4Chat.

73,

Rick Muething, KN6KB

Hello Rick,

I'm working KN6KB in Fla having a lot of dropouts about 90% good print Rick on my end. Seems I lose the first few charters about every 3 or 4th time I transmit not sure why? Some maybe because of multipathing on HF. What you think Rick? I have not heard you so far ,maybe this evening I will listen up on or after gray line ok?

Hi, Rick.

One issue, so far:

Flex 5K VAC functions well w/RMS Express and the Winmor TNC. Checked that before installing the new Chat4 client. Audio, CAT and XCVR control all function OK and I see decoded text from your station and a couple of others. When I transmit, however, at the end of my TX, I don't see the waterfall and nothing is decoded. I have to close and then reopen Chat4 to reestablish the waterfall. I checked again with RMS EXpress and it hasn't that issue. Chat4 exhibits the same behavior with a Bird load, so it's not an RF issue. Maybe a pointer gets lost in the TX-RX turnaround?

I'm gonna run a short session and send the logs from that.

Thanks and 73,

Tom N4TAB in NC

I am having some problem with the autoupdate mechanism so this will require a full install (and uninstall of a previous version of Chat). Note: this is installed in a separate directory and shares no data with the earlier V4Chat.

Rick,

UPDATE. Same problem with the two-tone Test. No RX after TX. Short Log files going direct

73,

Tom N4TAB

On 10/2/2013 4:39 PM, Tom Brown N4TAB wrote:

Hi, Rick.

One issue, so far:

Flex 5K VAC functions well w/RMS Express and the Winmor TNC. Checked that before installing the new Chat4 client. Audio, CAT and XCVR control all function OK and I see decoded text from your station and a couple of others. When I transmit, however, at the end of my TX, I don't see the waterfall and nothing is decoded. I have to close and then reopen Chat4 to reestablish the waterfall. I checked again with RMS EXpress and it hasn't that issue. Chat4 exhibits the same behavior with a Bird load, so it's not an RF issue. Maybe a pointer gets lost in the TX-RX turnaround?

I'm gonna run a short session and send the logs from that.

Thanks and 73,

Tom N4TAB in NC

On 10/2/2013 12:05 PM, Rick Muething wrote:

All,

I have posted a new version (now with significantly more testing!!!) of the Chat program and the H4TNC (Implements the new HAM4 Protocol). This is available for download from the Yahoo V4Protocol group FTP or the Winlink user FTP
ftp://autoupdate.winlink.org/User%20Programs/

The new Chat program and H4TNC does NOT replace the prior V4Chat. It is a new program that uses a new (hopefully more robust with lower latency) modulation and coding scheme. The current version 0.1.1.0 is considered alpha code but appears very functional. Only the FEC (broadcast) protocol is included initially …later ARQ. If this proves to be robust and effective I plan to use it to replace the older V4 TNC. I may make a future version of Chat that would support both protocols but this is not in the current plans.

The new Chat also contains a limited beacon mode to help with initial testing. I have placed a HAM4 beacon “HAM4 Test Beacon de KN6KB [EL98pf] that will be sent approximately every 10 minutes on 10.110.0 USB DIAL. If you download and install the Chat program from

above and set it up (help is included and updated). You should be able to hear/copy the beacon. You can also answer me with a reply if desired. I will be here most of the day but in and out. If you set up your own beacon please try and use this same frequency or frequency on another band. Please try and co ordinate beacon frequencies and use them sparingly. We don’t want to create an beacon interference.

My initial tests with the new coding scheme used in version 0.1.1.0 are very encouraging. I think the ARQ version will be equally good with higher robustness and easier operation. This new mode has very low latency (about 300 ms …faster than PSK31.)

I am having some problem with the autoupdate mechanism so this will require a full install (and uninstall of a previous version of Chat). Note: this is installed in a separate directory and shares no data with the earlier V4Chat.

GE All,

Downloaded latest after I got home from work (5PM). Since then I have heard and decoded a number of KN6NB's beacon calls, NY3J calling N4AY, a number of quick brown foxes ...., several of W4WEBs tests and something about "PEST DE N4AY".

Thought you guys would like to know you are being heard in Ohio EM89cv.

The spam filter is grabbing the messages that contain strings of characters in your posts. It requires we go in and allow each to be posted. Those posting H4TNC data, please be patient if your post does not appear right away. We will get to them as rapidly as possible.

Hi Hoby,

I am starting to copy kn6kb's beacon without errors so maybe the band is coming around.

3394. RE: Ham4 Chat

Yahoo group: V4Protocol
Date: 2013-10-03 12:57:17 UTC
From: Rick Muething
Topic: 3394 Message: 3394

Lee, All,

Thanks for the feedback. Here is what I know so far:

1) There is definitely a problem (which I now can duplicate here using "RF across the desk") where the auto tune DSP code is not working correctly. This is supposed to capture the sync symbol (sent initially and then again after every 7 printing characters. It seems to copy OK but only when exactly on (+/- a few Hz) the correct frequency..The algorithm (which is similar to and does work for V4) should auto tune to better than 1 Hz. (note this does not try and tune the radio.radios are way too slow for that.this offsets the DSP tone decoders so the decoders lie right on top of the 4 FSK tones) I will look into this but I have a busy day today so can't promise any success.

2) Your comment on the lead could be an issue on some setups. If the first sync character is missed it won't sync until the next one (7 printable characters later). For those using PTT keying (radios that support CAT PTT control or direct serial RTS DTR keying) that won't be a problem.But radios using VOX (or using sound cards that are "vox like" similar to the Rigblaster and SignaLink) this could be an issue and may require the addition of an initial pilot tone (not a sync character) to trigger the VOX. In this HAM4 protocol the sync "character" is really very special and efficient. It provides these important functions:

a. The sync provides a completely different amplitude and frequency profile so it is easily detectable from normal 4FSK symbols.

b. The sync provides the information (once every 1024 ms) on how to tune to less than 1 Hz error. This provides tracking and quick re sync. (When I get it to work!!)

c. The sync provides the information on how to establish accurate symbol and character framing.

3) In simulator testing I can copy the signal well into the negative S/N range (- 5 dB or lower) but my HF simulator cannot do any significant frequency offset (tuning) so this tuning issue will have to be tested using RF.

I have already had a few requests for features but at this alpha stage it is VERY important to keep the priorities in mind:

1) Fix the basic protocol.things like tuning, Keying, etc. FIRST If these aren't right more features won't help anyone

2) Provide good documentation..This is a significant task in itself and takes a lot of time. Get in the habit of reading the help. Make suggestions as to what is not clear or what else is needed. Although we all joke about "RTFM" if there is good documentation it saves a lot of time with questions that have already been answered.

3) Radio and sound card support. It takes a lot of time to write and test radio drivers and verify sound cards and it is not possible (with a part time 1 man programming effort) to support everything. But we want to add support for the new radios and other popular radios. (The IC-7100 is a good example.I just added this and it is a great little radio with a built in sound card that makes sound card modes really "plug and play")

4) Add the features where they make sense and provide value. The ARQ mode is tops on my list and I have started working on it but I am sure you all have other as well.

I'll leave the beacon on today if I can but I am not sure I will get answers to 1 and 2 in the next couple of days.

73 and thanks for the feedback and support.

Subject: Ham4 Chat

I haven't got a debug file for you yet but trying to. My first gut feeling is that there is some decoding issues. I was hearing a couple of strong stations with what appeared to good clean audio and printing nothing but garbage. On the other hand I have copied some beacons from a 4 station that was "hit and miss"....

I am not the expert here but I get the feeling that the program does not get off on the right foot when attempting to decode a station that has just started transmitting. It's like on the receiving end the radio does not have much of a "lead" in order to purge the receiver and get it to start copying. I recall in amtor FEC and Pactor FEC as soon as you went into transmit the signal would go into an idle mode. My hunch was that idling was enought to get the receiving end on track prior to any valid data being passed. So I wonder if in the Ham4 FEC mode, is the receiving end not getting a fair chance to purge prior to good copy?

Oh and the main text screen still jumps up and down when receiving incoming signals.

The new coding sounds like it has possibilities. Definitely a different sound from V4chat..

Nice work Rick, you dah MAN!!

Bob, All,

Thanks for the reports. The main problem is that the H4TNC auto tuning/tracking code is not working correctly and that means it requires near perfect (+/- a few Hz) tuning. I am working on that code (already found a couple of minor bugs) and hope to get something out this weekend. Once that is fixed it should be easier to evaluate.

Of course error free transmission will require the full ARQ version but I want to get the basic FEC mode working first.

I spent some time listening at 10.000 MHz to work out my tuning error and compensated for it, that may help a bit, but it was only 10Hz in my case, though it sounds as if that would stop it at present. Look forward to seeing a version with that defect corrected.

3417. H4TNC: My initial impressions

Yahoo group: V4Protocol
Date: 2013-10-04 15:59:43 UTC
From: <gary.k7ek@...>
Topic: 3417 Message: 3417

I've done a clean install on a robust Windows 7 HP laptop. Receiving has been so-so. I find that there's an over abundance of garbage characters interspersed with the desired text of received signals. I have received a few good signals but am getting mostly garbage, even on loud ones. Setting receive audio input versus squelch sensitivity is overly sensitive. Getting a balance in order to reliably print received signals is difficult at best.

Secondly, when attempting to initiate a call to someone, the program indicates that the transmission is in progress but no signal is transmitted. Beacons on the other hand transmit just fine. I am using a SignaLink USB which works well for all of the other sound card based programs including RMS Express and RMS TriMode with Winmor, etc.

I have to question the choice of 10.110. That is a heavily used CW frequency, especially for CW DXpeditions and the like. It would probably be more prudent (and friendly) to move any digital operation higher in the band. In Region II, 10.100 - 10.130 is generally CW. Please see this link for specifics:

http://30mdg.net/files/30%20Meter%20Band%20INFORMATION[1].pdf

Best regards,

Gary, K7EK

Hi Pat,

H4Chat is in Alpha testing right now. Rick, KN6KB, is testing the basic capabilities of just FEC chat mode. Soon he will release the code which would include ARQ mode and then you will be able to connect with another station or call CQ. Now in order to have a qso you have to type in the bottom of the window and press enter. So if you want to call CQ just manually enter the CQ text or create USER files with CQ text in it. If you want to try the other program that Rick wrote try the V4Chat Yahoo group to download the code:

http://groups.yahoo.com/neo/groups/V4Protocol/info

V4Chat is a finished program that has the ARQ connection capability. H4Chat is a similar program with a different more rebost virtual TNC program called H4FSK. Have fun and if you see me calling CQ on H4Chat please try to connect.

There isn't a specific radio setup for thr ICOM IC-7000. The generic ICOM option does not provide PTT. Using Rigblaster Plug and Play, which works fine with HRD, MultiPSK and other programs.

a. what are the correct rig settings for the IC-7000

b. what are the established HF frequencies for this V4 mode.

Thank you, Rich/N2JR

Rich,

The settings should be the same as HRD uses as far as the com port and
baud rate is concerned. Use the drop down menu to select them.

Rich,

I don’t have a 7000 here to verify with and right now I need to focus on the serious issue of problems with the auto tuning (poor decoding if more than a few Hz off frequency). Adding or refining radio types will have to come after that.

From: <la7um@...>
Topic: 3425 Message: 3425

Rick. Probably by an error, when putting in Chat Full Install 0.1.1.0.zip, the V4Chat full install 1.0.4.0 went away on the Winlink FTP site. I missed this and installed the CHAT alpha for a newbie fellow ham recently. Of course withouth ARQ, no joy for him.

This can probably happen for others who want to join the old ARQ test party of V4Chat at the time being until H4 is more mature and with ARQ running.

73. Finn/LA7UM

3426. RE: [V4Protocol] V4CHAT 1.0.4.0 Gone from Winlinks FTP site. ERROR?

Topic: 3425 Message: 3426

Hello Finn,

the V4Chat installation zip can be still found in the file section of the Yahoogroup. Login as a V4Protocol group member is required in order to access the file. link
Please ask the newbie fellow ham to register for the V4Protocol Yahoogroup.

In my opinion, the file should be republished for public access at the WinLink FTP site. But this decision has to be taken by WDT.

When All Else Fails, Ham Radio Works

3427. Chat version 0.1.2.0 Uploaded to Yahoo FTP, Winlink FTP and Winlink Autoupdate server.

Yahoo group: V4Protocol
Date: 2013-10-14 19:40:01 UTC
From: Rick Muething
Topic: 3427 Message: 3427

All,

I have spent a lot of time on this the last couple of weeks fixing bugs and adding refinements. It is working well with one known exception: I am still having auto tune problems if the station offset is > +/-10 Hz or so. It should work and I have a backup method to do this if necessary but I wanted to get this release out for some feedback. There are several other important fixes and updated help.

I have my Ham 4 beacon currently on 10110.000 USB dial at 50 watts from Grid Square EL98pf (Florida East Coast near Melbourne). Depending on our receiver dial accuracies you should be able to hear it +/- about 30 Hz. The easiest way to tune now (until I get the auto tuning expanded range working correctly) is to set Chat tuning range to +/-10 Hz and place the received signal directly between the green waterfall lines. (If you are using radio control you can use click to tune by placing the mouse cursor in the MIDDLE of the observed spectrum (which is about 200 Hz wide).

For convenience I have also placed the full install of both Chat and V4Chat (remember these are NOT the same program and the decoding is not compatible!) on the Yahoo FTP site and the Winlink User program FTP site. ftp://autoupdate.winlink.org/User%20Programs/ I have also placed the program on the auto update server. Restarting your Chat program should prompt an auto update (it may take a few minutes).

Feel free to leave a reply if you copy the beacon. If I am here at the desk I will try and answer.

73,

Rick Muething, KN6KB

All I have to do is read!. OK got tuning range set to 10. Was playing with TNC tuning range!
Weird, with new version, when I activate TX buffer, my TNC display minimizes and when I bring it back, I can't type in buffer nor transmit.
Any idea as to what I have done there?
Good QSO with NY3J and good print on Rick's beacon.

All,

<SNIP>

I have my Ham 4 beacon currently on 10110.000 USB dial at 50 watts from Grid Square EL98pf (Florida East Coast near Melbourne). Depending on our receiver dial accuracies you should be able to hear it +/- about 30 Hz. The easiest way to tune now (until I get the auto tuning expanded range working correctly) is to set Chat tuning range to +/-10 Hz and place the received signal directly between the green waterfall lines. (If you are using radio control you can use click to tune by placing the mouse cursor in the MIDDLE of the observed spectrum (which is about 200 Hz wide).

<SNIP>

GM, Rick. Chat setup does accept "10" as a value, but if you try to do a TNC BASIC SETUP, an exception log is generated and says that the "value must be between Maximum and Minimum. Then the TNC screen closes. If you have your TNC basic setup generated before you select the "10" for a value, nothing bad happens. BUT, if you try to set up the value in CHAT setup first, you are out of luck.
Do you need the exception log?

3437. Chat Beta version 0.1.3.0 full install Uploaded to Yahoo FTP, Winlink FTP and Winlink Autoupdate server

Yahoo group: V4Protocol
Date: 2013-10-19 01:22:04 UTC
From: Rick Muething
Topic: 3437 Message: 3437

All,

I have made several changes (see below) with adding and fixing some features. Tuning range is still not what it should be but seems better (generally +/- 20 Hz). Decoding will be best if with +/- 10Hz.

The program should auto update. Full installs also available at the Yahoo FTP site and the Winlink FTP sites.

I will leave my beacon running on 10110.00 Khz (50 watts) for testing. You can leave a reply if you are copying OK. If I am here I will try and answer. (Right now very high multipath and considerable "roaring").

I have started work on the ARQ mode .at least all the critical specs and documentation. Will probably be a month. I still want to improve the tuning capability to at least +/- 50 Hz.

Your feedback and comments welcome.

73,

Rick Muething, KN6KB

Chat Revision History

Date: Rev Change Summary

Oct 18, 2013 0.1.3.0 Release of 0.1.2.1 to beta

Oct 16, 2013 0.1.2.1 Change default leader length from 200 ms to 128 ms

Change default Tuning range
from 100 to 50 Hz.

Allow call signs to include
Prefix (e.g. "XE2/") or postfix (e.g. "/MM") in addition to -ssids.

Hold off any beacons for
beacon interval minutes in FEC mode after manual keyboard entry.

Change default character set
to ASCII (7 bit)

Oct 14, 2013 0.1.2.0 Beta Release of 0.1.1.2 (still issues with exanded tuning range)

Oct 13,2013 0.1.1.2 Modify send on Word option (space) to "Word or
CR" (Now sends keyboard text on word or a CR)

Add logic to minimize
session text box "jumping" during updates. (still not perfect but much
better)

Limit tuning range to +/-
100 Hz default = 50.

Changed minimum tuning range
from 20 to 10.

Added logic to unlock
scrolling on main form resize.

Update Help

Oct 2, 2013 0.1.1.1 Change display update from "CF:" to "USB Dial:"

Oct 1, 2013 0.1.1.0 Alpha release of 0.1.0.2 with Updated Help

Sept 30, 2013 0.1.0.2 ARQ mode select blocked (not yet implemented)

Change default tuning range
to +/- 50Hz (was 100)

Update Radio.vb for 7100
radio control (needs to be verified)

Add background color (light
blue) to keyboard entry and beige to received data text boxes.

Add beacon setup menu and
FEC beacon option (10 -120 minutes) (To be used for inital testing)

Update Help.

July 10, 2013 0.1.0.1 Initial Alpha release FEC only H4FSK TNC
revision 0.1.0.1

H4FSK TNC Revision History

Date: Rev Change Summary

Oct 18, 2013 0.1.3.0 Release of 0.1.2.1 to beta

Oct 18, 2013 0.1.2.1 Allow call signs to include
Prefix (e.g. "XE2/") or postfix (e.g. "/MM") in addition to -ssids.

Change Rcvd
Frame labels to "Sync" and "Data" (was "FEC Sync" and "FEC Data") in
preparation for ARQ mode.

Replace
H4Demod.Decode8BitCharacter with MixDecode8BitCharacter using NCO (nominal

frequency 1125 Hz) to mix

filtered
data down to 375 Hz (center bin) for wider "tuning" and more optimal
center-of-bin decoding.

Add second
overload of H4Demod.GoertzelRealImag for floating input

Add
H4Demod.TrackTwoTone62BMix to replace TrackTwoTone62B with floating point
mixing to 375 Hz center.

Add menu
display and toggle of current character set.

Added
current MY CALL to the main window description.

In
H4Mod.GenerateSync62Baud Reduce peak amplitude of sync to same as 4FSK tones
to reduce opportunity of sync amplitude distortion.

Extensive
modifications in H4Demod.SearchForSymbolSync62BMix, SearchForSync62B,
TrackTwoTone62BMix for improved signal acquisition and tracking

Modify
SearchForTwoTone63BG to add (H4CB.Squelch/10) to the ratio calculation

Fix
Interface.TWOTONETEST function to allow repeats. (now works either from TNC
menu or Chat Setup menu correctly)

Update Help

Oct 14, 2013 0.1.2.0 Beta release of 0.1.1.1

Oct 3, 2013 0.1.1.1 Found two cases
(H4Demod.SearchForTwoTone62B3 and TrackTwoTone62B) where computation of
dblOffsetHz had sign reversed.

Significant
updates on tuning and tracking mechanisms (tuning range still limited to
approx +/- 10 Hz... needs work)

Update Help
and state diagrams.

Add Help
Index selection option to H4TNC form

Oct 1, 2013 0.1.1.0 Alpha releae of 0.1.0.3 with
update help.

Sept 30, 2013 0.1.0.3 Add code to remember window
state on shutdown.

Update H4TNC
Help

Correct
CLOSE command with text "H4TNC.CLOSE"

Change name
of Playback State "TransmitFEC" to "XmitFEC" to better fit in status window.

Eliminate
Capture state Sync (not used)

Modify debug
loggging to capture and characters and display decode distance and

compute/display avg frame decode distance using new sub
H4Demod.LogFECFrameStats

Aug 10, 2013 0.1.0.2 Modify Two tone command.

Change
Character encodeding from 8,4,4 extended hamming to expand hamming distance
slightly

Modify
H4Demod.Decode8BitCharacter to pass EOT (value = 4) to TNC's character
crawler

Modify
SearchForTwoTone to H4Demod.SearchForTwoTone62B3.

Modify
H4Demod.TrackTwoTone62B

July 10, 2013 0.1.0.1 Initial Alpha release FEC
only

From: Rick Muething
Topic: 3440 Message: 3440

All,

Thanks to important feedback from Lee NR5G I have made a quick patch to the last release. The problem had to do with classic Windows color schemes being too dark for the new color used in the H4 TNC menu background. Although this required only a small change on the H4 TNC I had to update the rev of Chat to 0.1.4.0 to get the auto update to trigger. The only change to the 0.1.3.0 version is this background color (now lighter) on the H4 TNC.

Programs should auto update but full installs also reloaded to Yahoo and Winlink FTP sites.

Thanks Lee for the feedback.

Rick Muething

Hi Rick,

Receiving your beacon just fine this Saturday 10/19/13 on short daytime skip here in Arcadia, FL.

10.110.00 Mhz is traditionally CW territory on 30 meters, Rick.I see them all the time above on and below our QRG. I would like to suggest that most anything above 10.130.00 Mhz would be more appropriate for our mode. From there on up you will find most all of the non CW digital modes. Only suggesting we follow the current band use and not unknowing move in on our CW friends where they normally operate.

73/Russ
K1DOW
Arcadia, FL..

Thanks Russ,

No problem with moving the beacon frequency to avoid CW. I would avoid anything 10.140-10.150…that is the auto forward sub band usually reserved for wide band modes. We should try and stay away from the Pactor and WINMOR forwarding frequencies primarily 10130 and above. I would suggest 10120.00. That leaves the bottom 20 KHz for CW only. Anyone have any comment?

Making some progress on decoding improvements. Testing it out here first.

Hi Rick,

Receiving your beacon just fine this Saturday 10/19/13 on short daytime skip here in Arcadia, FL.

10.110.00 Mhz is traditionally CW territory on 30 meters, Rick.I see them all the time above on and below our QRG. I would like to suggest that most anything above 10.130.00 Mhz would be more appropriate for our mode. From there on up you will find most all of the non CW digital modes. Only suggesting we follow the current band use and not unknowing move in on our CW friends where they normally operate.

All,

Thanks to important feedback from Lee NR5G I have made a quick patch to the last release. The problem had to do with classic Windows color schemes being too dark for the new color used in the H4 TNC menu background. Although this required only a small change on the H4 TNC I had to update the rev of Chat to 0.1.4.0 to get the auto update to trigger. The only change to the 0.1.3.0 version is this background color (now lighter) on the H4 TNC.

Programs should auto update but full installs also reloaded to Yahoo and Winlink FTP sites.

Thanks Lee for the feedback.

Steve,

Actually that would be a significant change as it has big repercussions in the DSP code. The receiver IF filters are not that critical or necessary.there is already a narrow (~300 Hz) audio filter centered at 1523 Hz in the DSP code that will filter out most noise and QRM. The main reason other receive filters would be necessary is to try to eliminate adjacent channel QRM that is pumping the receivers AGC. Otherwise these signals will be filtered out and ignored by the built in 300 Hz audio filter.

Most HF modes and TNCs now standardize on approximately 1500 Hz (WINMOR, PACTOR 2, 3, 4 etc) since most receivers generally center the IF filters on that value. Using the normal SSB filters should work fine most of the time and I can see no difference in weak signal decoding ability using a SSB filter or a narrow 240 Hz CW filter.

All,

To minimize any interference from CW on 30 meters I have moved the beacon to 10123.00 USB dial with power at 10 Watts.

This should avoid most CW and Pactor/WINMOR forwarding activity.

Beacon interval currently at 10 minutes.

73,

Rick KN6KB

10.120mhz sounds like a good plan, whatever keeps the peace... what will be even better is when we have stations standing in line to make contacts like back in the mid 1980s. I'd hate to NOT USE it and then LOSE it. It makes my day when I can tune across the digital portion of the bands to find it busy with many of the "exotic" modes. "Digital Modes....are the STUFF!!"

You should be able to move your filter if you press and hold the IRT button then use the clarifier to move your IF. Works for me on the 897 and I believe the 857 has the same features.I note Ricks comment that it will not improve performance but sometimes it is just easier on the ears with a filter in place.

3460. Chat 0.1.5.0 Uploaded to Yahoo FTP, Winlink FTP server and Autoupdate server.

Yahoo group: V4Protocol
Date: 2013-10-21 12:52:58 UTC
From: Rick Muething
Topic: 3460 Message: 3460

All,

Persistence pays off!!! I finally found and fixed the major bug limiting the tuning range. With 0.1.5.0 the automatic tuning range as specified in the Chat setup is fully operational. A good operating point is 50 Hz (Tunes for offsets of +/- 50 Hz) but this can be set anywhere from 10 to 100 Hz. A recommended squelch value is 4 or 5. Squelch values of 3 or even 2 can be used for very weak signal copying but these will increase the amount of "open" printing.

I will be heading out of town for about 10 days on Thurs (Oct 24th) so probably won't be able to make many more updates. This seems pretty solid and I will now start to work on the ARQ mode (probably will be a month or so).

The full install package is available on the Yahoo V4Protocol FTP site and the Winlink FTP site ftp://autoupdate.winlink.org/User%20Programs/

Appreciate your feedback and comments. I will leave my beacon on at 10123.00 USB dial running 10 watts.

73,

Rick KN6KB

Chat Revision History

Date: Rev Change Summary

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

Oct 20, 2013 0.1.4.1 Clean up Exception logging with respect to file system errors and capture error # to Exception log.

Indicate when beacon sent on
main log (purple)

Change Globals.TimestampEX
to not show decimal seconds.

Add detect and recovery code
in grdContacts_MouseClick to handle exception if grid is right clicked without a row selected.

Oct 19, 2013 0.1.4.0 Release with H4TNC main menu bar backcolor changed to accomodate classic windows setup (was too dark). No changes to Chat from 0.1.3.0

Oct 18, 2013 0.1.3.0 Release of 0.1.2.1 to beta

Oct 16, 2013 0.1.2.1 Change default leader length from 200 ms to 128
ms

Change default Tuning range
from 100 to 50 Hz.

Allow call signs to include
Prefix (e.g. "XE2/") or postfix (e.g. "/MM") in addition to -ssids.

Hold off any beacons for
beacon interval minutes in FEC mode after manual keyboard entry.

Change default character set
to ASCII (7 bit)

H4FSK TNC Revision History

Date: Rev Change Summary

Oct 21, 2012 0.1.5.0 Release of 0.1.4.1

Oct 21, 2013 0.1.4.1 Make mods in
H4Demod.ProcessNewSamples to base detection of sync in TUNE state dependent
on prior and next cor values. This

Improves
tuning accuracy, sync detection and reduces "open" printing on low values of
squelch.

Redcuce and
cleanup Debug logging.

Modify
H4Demod.TrackTwoTone62BMix to use squelch to compute ratio and use
uninterpolated bin values for dblMaxCor calculation.

Fix
H4Demod.SearchForSymbolSync62BMix to use mixed data and bin 6 for Goertzel
phase search.(was bin 12) Now have full tuning range.

Oct 19, 2013 0.1.4.0 Change of backcolor on H4TNC
menu line to Gradient Active to avoid too dark a background in classic
windows setup. No other changes.

Oct 18, 2013 0.1.3.0 Release of 0.1.2.1 to beta

Oct 18, 2013 0.1.2.1 Allow call signs to include
Prefix (e.g. "XE2/") or postfix (e.g. "/MM") in addition to -ssids.

Change Rcvd
Frame lables to "Sync" and "Data" (was "FEC Sync" and "FEC Data") in
preparation for ARQ mode.

Replace
H4Demod.Decode8BitCharacter with MixDecode8BitCharacter using NCO (nominal frequency 1125 Hz) to mix

filtered
data down to 375 Hz (center bin) for wider "tuning" and more optimal center-of-bin decoding.

Add second
overload of H4Demod.GoertzelRealImag for floating input

Add
H4Demod.TrackTwoTone62BMix to replace TrackTwoTone62B with floating point mixing to 375 Hz center.

Add menu
display and toggle of current character set.

Added
current MY CALL to the main window description.

In
H4Mod.GenerateSync62Baud Reduce peak amplitude of sync to same as 4FSK tones to reduce opportunity of sync amplitude distortion.

Extensive
modifications in H4Demod.SearchForSymbolSync62BMix, SearchForSync62B, TrackTwoTone62BMix for improved signal acquisition and tracking

Modify
SearchForTwoTone63BG to add (H4CB.Squelch/10) to the ratio calculation

Fix
Interface.TWOTONETEST function to allow repeats. (now works either from TNC menu or Chat Setup menu correctly)

Update Help

Excellent improvement in Chat 0.1.5.0 Rick! Printing your beacon and a handful of others this Monday afternoon in Arcadia, FL.

A small suggestion regarding the choice of RX text color on the RX screen. It appears as green on a pale orange background here. For my vision black would be a lot easier to read. Understood though if there is a need for the color of the text being set as it is now. No problem. The MAIN THING is that the decode and expanded capture area on the WF is mucho improved! Congratulations on your persistence Rick! :-)

Thanks for the feedback Russ. Well there is a need to support several colors on the received text (currently Green, Red, Navy, Black, Purple). When I switched the background over to the beige and light blue I didn't change any of the text colors. I'll play with that some. There are probably better choices.

Rick

Excellent improvement in Chat 0.1.5.0 Rick! Printing your beacon and a handful of others this Monday afternoon in Arcadia, FL.

A small suggestion regarding the choice of RX text color on the RX screen. It appears as green on a pale orange background here. For my vision black would be a lot easier to read. Understood though if there is a need for the color of the text being set as it is now. No problem. The MAIN THING is that the decode and expanded capture area on the WF is mucho improved! Congratulations on your persistence Rick! :-)

---In V4Protocol@yahoogroups.com, <v4protocol@yahoogroups.com> wrote:

All,

Persistence pays off!!! I finally found and fixed the major bug limiting the tuning range. With 0.1.5.0 the automatic tuning range as specified in the Chat setup is fully operational. A good operating point is 50 Hz (Tunes for offsets of +/- 50 Hz) but this can be set anywhere from 10 to 100 Hz. A recommended squelch value is 4 or 5. Squelch values of 3 or even 2 can be used for very weak signal copying but these will increase the amount of "open" printing.

I will be heading out of town for about 10 days on Thurs (Oct 24th) so probably won't be able to make many more updates. This seems pretty solid and I will now start to work on the ARQ mode (probably will be a month or so).

The full install package is available on the Yahoo V4Protocol FTP site and the Winlink FTP site ftp://autoupdate.winlink.org/User%20Programs/

Appreciate your feedback and comments. I will leave my beacon on at 10123.00 USB dial running 10 watts.

73,

Rick KN6KB

Chat Revision History

Date: Rev Change Summary

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

Oct 20, 2013 0.1.4.1 Clean up Exception logging with respect to file system errors and capture error # to Exception log.

Indicate when beacon sent on main log (purple)

Change Globals.TimestampEX to not show decimal seconds.

Add detect and recovery code in grdContacts_MouseClick to handle exception if grid is right clicked without a row selected.

Oct 19, 2013 0.1.4.0 Release with H4TNC main menu bar backcolor changed to accomodate classic windows setup (was too dark). No changes to Chat from 0.1.3.0

Oct 18, 2013 0.1.3.0 Release of 0.1.2.1 to beta

Oct 16, 2013 0.1.2.1 Change default leader length from 200 ms to 128 ms

Change default Tuning range from 100 to 50 Hz.

Allow call signs to include Prefix (e.g. "XE2/") or postfix (e.g. "/MM") in addition to -ssids.

Hold off any beacons for beacon interval minutes in FEC mode after manual keyboard entry.

Change default character set to ASCII (7 bit)

H4FSK TNC Revision History

Date: Rev Change Summary

Oct 21, 2012 0.1.5.0 Release of 0.1.4.1

Oct 21, 2013 0.1.4.1 Make mods in H4Demod.ProcessNewSamples to base detection of sync in TUNE state dependent on prior and next cor values. This

Improves tuning accuracy, sync detection and reduces "open" printing on low values of squelch.

Redcuce and cleanup Debug logging.

Modify H4Demod.TrackTwoTone62BMix to use squelch to compute ratio and use uninterpolated bin values for dblMaxCor calculation.

Fix H4Demod.SearchForSymbolSync62BMix to use mixed data and bin 6 for Goertzel phase search.(was bin 12) Now have full tuning range.

Oct 19, 2013 0.1.4.0 Change of backcolor on H4TNC menu line to Gradient Active to avoid too dark a background in classic windows setup. No other changes.

Oct 18, 2013 0.1.3.0 Release of 0.1.2.1 to beta

Oct 18, 2013 0.1.2.1 Allow call signs to include Prefix (e.g. "XE2/") or postfix (e.g. "/MM") in addition to -ssids.

Change Rcvd Frame lables to "Sync" and "Data" (was "FEC Sync" and "FEC Data") in preparation for ARQ mode.

Replace H4Demod.Decode8BitCharacter with MixDecode8BitCharacter using NCO (nominal frequency 1125 Hz) to mix

filtered data down to 375 Hz (center bin) for wider "tuning" and more optimal center-of-bin decoding.

Add second overload of H4Demod.GoertzelRealImag for floating input

Add H4Demod.TrackTwoTone62BMix to replace TrackTwoTone62B with floating point mixing to 375 Hz center.

Add menu display and toggle of current character set.

Added current MY CALL to the main window description.

In H4Mod.GenerateSync62Baud Reduce peak amplitude of sync to same as 4FSK tones to reduce opportunity of sync amplitude distortion.

Extensive modifications in H4Demod.SearchForSymbolSync62BMix, SearchForSync62B, TrackTwoTone62BMix for improved signal acquisition and tracking

Modify SearchForTwoTone63BG to add (H4CB.Squelch/10) to the ratio calculation

Fix Interface.TWOTONETEST function to allow repeats. (now works either from TNC menu or Chat Setup menu correctly)

Update Help

Harry,

There are some minor issues that I am cleaning up but some of your comments don't apply.

First you have 4 choices of how to enter text and queue it.I would recommend using CR to start (send on a CR). You can play with the other .personal preference. When you enter text BEFORE it is sent it is blue italic in the lower box. You can edit it there before it is sent. When it is transferred to the H4 TNC for transmission (CR, Ctrl CR, Word, etc) it is changed to gray and can no longer be edited (it is being sent).

Received text is shown in the upper window as received. It is currently green .may change that on next rev for improved readability. The transmitted data is NOT shown in the beige box currently. I'll look into that .it might make it more readable

I will try and confirm everything works like above before the next release.but no one reporting any problems with it and I made several QSOs today.

OB Queue was not implemented on that last rev 0.1.5.0. Will be on the next. It buffers allowing you to send while things are still being sent .they just queue up and show in the outbound queue. Once sending is finished (EOT sent) if there is anything in the out bound queue it will be sent. I have this working now here. I will also have the auto ID feature working on the next rev.

One of the challenges here is there are umpteen ways to show text, colors, sizes etc and it is impossible to please everyone and making it completely customizable is a big effort. I have tried to put in the more useful options (e.g. Send commands and text size) but at this stage of the program I don't want to get bogged down in all the frills of text display. It may look simple but handling scrolling rich text boxes of multiple colors is a real programming challenge.

Thanks for your feedback.

Harry,

Tnx for the short qso around 1 PM EDST. Had to get back to work.

There were several other stations in there at about the same time. I don't think everyone was copying each other.

H4 seems to be working ok on my old XP computer.

Thanks Jouko,

One of the objectives I have for the protocol and Chat Host is to work well with all the main character sets. The Latin-1 ASCII extension and the UTF-8 (multi-byte) character sets allow many non-English characters and languages. Hopefully this will promote adoption in foreign languages (I may ask for volunteers for help with multi language help etc!!!)

With FEC there can always be some character errors (there is no automatic “back channel” to request repeats). The amount of FEC I selected was (as always) an engineering compromise between speed (using weaker and less Robust FEC) and error correction capability (using stronger FEC coding). I think the current selection is pretty close to optimum for normal signal level work. With more time it should be possible to continue with small improvements in the tuning, sync and character decoding. Once the ARQ mode is working it will permit sessions with zero errors but of course it only permits two stations to be in communication not a net like FEC does and the throughput will only be about 60-70% or so of the current FEC mode which is now about 68 words per minute.

3470. Chat 0.1.6.0 Uploaded to Yahoo FTP, Winlink FTP and Autoupdate server

Yahoo group: V4Protocol
Date: 2013-10-22 23:13:22 UTC
From: Rick Muething
Topic: 3470 Message: 3470

All,

This should be my last update before leaving for about 10 days. The decoding on this version is the same as 0.1.5.0 but a number of cleanup items are done including functional fixes to things like Outbound buffer queue, Auto ID, logging, display of text sent etc. I also made passes through the help files and fixed many of the contradictory statements (left over from the old V4 Help file).

It seems to be working well. I have started on the ARQ mechanism and want to get that well defined and documented before starting to modify the code.

Please report any serious errors. Be sure to look in the help If you have questions it covers many questions.

Thanks again for the feedback and interest.

73,

Rick KN6KB

Chat Revision History

Date: Rev Change Summary

oct 22, 2013 0.1.6.0 Release of 0.1.5.1

Oct 21, 2013 0.1.5.1 Eliminate separate Full and Half duplex FEC modes...basically always full duplex if radio will permit, otherwise half duplex.

Change Text display for
improved readability: Inbound FEC text black (was green), Info text Navy ItalicText (was black)

Text as sent (green) others
unchanged.

Increased brightness of rich
text box backgrounds (light beige and light blue) for increased contrast.

Fix AutoID function
(controlled by Host)

Add code to display text as
sent (Green) on the session rich text box and received text (black).

Implement the Outbound queue
and buffer reporting.

Make mods to
Main.UpdateSessionDisplay to buffer FEC received text for logging (makes
Chat.log more readable)

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

H4FSK TNC Revision History

Date: Rev Change Summary

Oct 22, 2013 0.1.6.0 Release of 0.1.5.1

Oct 21, 2013 0.1.5.1 Remove decoder test ....was
confusing and only used to verify initial character coding table.

Modify
H4Mod.GenerateLeader to taper on leading and trailing 24 samples (2ms) to
reduce "clicks"

Add
Globals.AddToOutboundPending and ClearOBQueue to handle Queue data if
already playing

Add OB
Queue: label on main form and mechanism to update status to Host.

Fix AutoID
function (normally selected by host).

Send
ENCODING command to Chat whenever Encoding character set is changed.(allows
proper display and logging)

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

Pete,

I can’t get set up right now for a test on the Flex (I have a Flex 3000 available but no time!). But I would suggest you try the help in the Chat (File, Help Index, Flex SDR radios). That section was “lifted” from the prior V4 Chat help file which was verified and should still work about the same. If it works (or you find a problem or get a configuration that works) let me know and I’ll update the help on the next Rev.

Pete,

Yes, I have used both my 3000 and 5000 without difficulty. You obviously have paired your PTT with another com port. Use this com port as your PTT control. Also,, (in PWSDR), be sure to set delay time to 0ms. If you need further assistance, look me up on QRZ.com, drop me an email and we can set up a time where I can either call you on the phone or use Skype. My Skype address is k6kar1

73,
Kirk, K6KAR.

I can’t get set up right now for a test on the Flex (I have a Flex 3000 available but no time!). But I would suggest you try the help in the Chat (File, Help Index, Flex SDR radios). That section was “lifted” from the prior V4 Chat help file which was verified and should still work about the same. If it works (or you find a problem or get a configuration that works) let me know and I’ll update the help on the next Rev.

GM Rick,

I notice two things happen everytime I open up CHAT. The noise blanker always gets turned OFF and the rig's antenna tuner gets turned ON!! I really don't want either of those things to happen. Otherwise, the rig control works well. I am using a TS-2000.

Hope your trip goes well.

Rick,

I'd be happy to do that. I'll email you directly with any potential changes.

With regard to beaconing, would you please shorten the beacon timing? For me, I'd like to see it at 5 minutes and if it's easily doable, have it adjustable in 1 minute increments. i.e. 1 minute to 20 minutes.

Chat Revision History

Date: Rev Change Summary

oct 22, 2013 0.1.6.0 Release of 0.1.5.1

Oct 21, 2013 0.1.5.1 Eliminate separate Full and Half duplex FEC modes...basically always full duplex if radio will permit, otherwise half duplex.

Change Text display for improved readability: Inbound FEC text black (was green), Info text Navy ItalicText (was black)

Text as sent (green) others unchanged.

Increased brightness of rich text box backgrounds (light beige and light blue) for increased contrast.

Fix AutoID function (controlled by Host)

Add code to display text as sent (Green) on the session rich text box and received text (black).

Implement the Outbound queue and buffer reporting.

Make mods to Main.UpdateSessionDisplay to buffer FEC received text for logging (makes Chat.log more readable)

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

H4FSK TNC Revision History

Date: Rev Change Summary

Oct 22, 2013 0.1.6.0 Release of 0.1.5.1

Oct 21, 2013 0.1.5.1 Remove decoder test ....was confusing and only used to verify initial character coding table.

Modify H4Mod.GenerateLeader to taper on leading and trailing 24 samples (2ms) to reduce "clicks"

Add Globals.AddToOutboundPending and ClearOBQueue to handle Queue data if already playing

Add OB Queue: label on main form and mechanism to update status to Host.

Fix AutoID
function (normally selected by host).

Send
ENCODING command to Chat whenever Encoding character set is changed.(allows proper display and logging)

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

Rick,

V4CHAT also turns the NB off. Don't remember about the antenna tuner. RMS Express also turns the NB off and I don't remember if it turns the antenna tuner ON or not. Also, everytime the programs open up my rig gives me an audible double beep and things change. I suspect you have used common coding between them for rig control. Why reinvent the wheel, right?

In any case, I don't mind the double beep I would just like to not have to turn the NB back on and turn the AT off everytime I use one of those program. Getting old and sometimes forget. :-)

FLDIGI which uses Hamlab for control does not mess with either function and opens up quietly.

Just something to think about. :-)

Hi Michael,

why a V4Chat beacon in the cw portion of the 30-m-band and not above 10140 kHz (digimodes)?

Pete,

I am sure the Flex can be tuned by command…basically the same commands as Kenwood. There are users of RMS Trimode (uses a similar radio control driver as Chat) that routinely "scan" using radio control of Flex radios. The click to tune on the H4TNC should work for the flex but I haven't confirmed it.

Hi Rick:

Yes, but I don't have a Flex, never said I did. Can't afford anything close to that.

I'm using GSDR to drive a SoftRock 6.2, which is running crystal controlled on 8 MHz to a Heath SB-1400 which is acting as a tunable transverter, and even if I could write software for it, it doesn't have the computer interface option.

Has been working fine for a year or so all Fldigi/FreeDV modes, as well as AM and CW with a Delta 44.

-Pete

Subject: RE: [V4Protocol] RE: SDR/PSDR

Pete,

I am sure the Flex can be tuned by command…basically the same commands as Kenwood. There are users of RMS Trimode (uses a similar radio control driver as Chat) that routinely “scan” using radio control of Flex radios. The click to tune on the H4TNC should work for the flex but I haven’t confirmed it.

Hi Kirk:

Thanks for the reply. Couple more specific questions, then:

What is PWSDR?

Does the CAT Control function not work for COM port CAT? It performs PTT with Fldigi, HRD, FreeDV, etc. when paired with vspMgr 1.0.3 and VAC 4.9.

If I set it up for PTT Control, what do you set the RTS/DTR to? What do you set the ID as?

Also, I'm only looking for PTT here, this radio setup cannot be tuned by computer.

Thanks.

-Pete

Pete,

Yes, I have used both my 3000 and 5000 without difficulty. You obviously have paired your PTT with another com port. Use this com port as your PTT control. Also,, (in PWSDR), be sure to set delay time to 0ms. If you need further assistance, look me up on QRZ.com, drop me an email and we can set up a time where I can either call you on the phone or use Skype. My Skype address is k6kar1

From: Rick Muething
Topic: 3470 Message: 3488
Attachments: 2 described; binary payloads are missing from this source WARC

Dave,

I'll take out the Kenwood commands that turn off the Noise blanker, Noise Reducer and Beat Canceller. Those shouldn't be needed (it will just leave the radio as is) but will probably be OK if left active (it's hard to predict what some of these DSP based "filters" will do to the signal but 4FSK is more tolerant than PSK or QAM modes). In general Radio DSP functions like noise blankers and DSP notches add distortion and unpredictability to the received waveform of digital modes that can't be easily undone. The tight audio filters and Goertzel tone decoders using in the H4 TNC should be all the digital "filtering" that is necessary.

The beep you hear is the result from a command from Chat to read the radio dial. Basically the radio gives a beep every time it receives a command (usually the default setting of the radio) but you can usually turn it off in a menu of the radio. It is similar radio control code to RMS Express but there are some differences (e.g. RMS Express doesn't read back the radio dial or support "click-to-tune" like Chat does).

I generally don't like trying to "piggy back" on existing 3rd party control interfaces or software. Some of these (e.g. Ham radio deluxe etc. not sure about Hamlab) introduce significant delays (due to software polling) and that can cause serious degradation and variation on Transmit > Receive latency which is critical on ARQ modes. Any delay or uncertainty in the T>R or R>T timing ends up requiring larger timing margins and can significantly affect ARQ net throughput and reliability.

73 and thanks for the feedback,

Rick KN6KB

Rick,

V4CHAT also turns the NB off. Don't remember about the antenna tuner. RMS Express also turns the NB off and I don't remember if it turns the antenna tuner ON or not. Also, everytime the programs open up my rig gives me an audible double beep and things change. I suspect you have used common coding between them for rig control. Why reinvent the wheel, right?

In any case, I don't mind the double beep I would just like to not have to turn the NB back on and turn the AT off everytime I use one of those program. Getting old and sometimes forget. :-)

FLDIGI which uses Hamlab for control does not mess with either function and opens up quietly.

Just something to think about. :-)

GM Rick,

I notice two things happen everytime I open up CHAT. The noise blanker always gets turned OFF and the rig's antenna tuner gets turned ON!! I really don't want either of those things to happen. Otherwise, the rig control works well. I am using a TS-2000.

Hope your trip goes well.

Dave K3GAU

On Oct 22, 2013 7:13 PM, "Rick Muething" <rmuething@...> wrote:

All,

This should be my last update before leaving for about 10 days. The decoding on this version is the same as 0.1.5.0 but a number of cleanup items are done including functional fixes to things like Outbound buffer queue, Auto ID, logging, display of text sent etc. I also made passes through the help files and fixed many of the contradictory statements (left over from the old V4 Help file).

It seems to be working well. I have started on the ARQ mechanism and want to get that well defined and documented before starting to modify the code.

Please report any serious errors. Be sure to look in the help If you have questions it covers many questions.

Thanks again for the feedback and interest.

73,

Rick KN6KB

Chat Revision History

Date: Rev Change Summary

oct 22, 2013 0.1.6.0 Release of 0.1.5.1

Oct 21, 2013 0.1.5.1 Eliminate separate Full and Half duplex FEC modes...basically always full duplex if radio will permit, otherwise half duplex.

Change Text display for improved readability: Inbound FEC text black (was green), Info text Navy ItalicText (was black)

Text as sent (green) others unchanged.

Increased brightness of rich text box backgrounds (light beige and light blue) for increased contrast.

Fix AutoID function (controlled by Host)

Add code to display text as sent (Green) on the session rich text box and received text (black).

Implement the Outbound queue and buffer reporting.

Make mods to Main.UpdateSessionDisplay to buffer FEC received text for logging (makes Chat.log more readable)

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

H4FSK TNC Revision History

Date: Rev Change Summary

Oct 22, 2013 0.1.6.0 Release of 0.1.5.1

Oct 21, 2013 0.1.5.1 Remove decoder test ....was confusing and only used to verify initial character coding table.

Modify H4Mod.GenerateLeader to taper on leading and trailing 24 samples (2ms) to reduce "clicks"

Add Globals.AddToOutboundPending and ClearOBQueue to handle Queue data if

already playing

Add OB
Queue: label on main form and mechanism to update status to Host.

Fix AutoID
function (normally selected by host).

Send
ENCODING command to Chat whenever Encoding character set is changed.(allows proper display and logging)

Oct 21, 2013 0.1.5.0 Release of 0.1.4.1

I'm going to tag along on this thread and announce that I had my first Chat connect with KF5IAD on 14073.000 this morning at 1536Z or thereabouts. Broke the ice with the newest Chat release Rick just put out.

Is there a migration trend to 10Mhz now for Chat operation? I don't have an antenna for that range yet.

I have to say that using Chat surprised me a little. I initially used WORD to initiate transmission as I was expecting words to be sent as I completed them on ONE LINE. Then, when I hit CR, I'd create a new line - - DUH. <GRIN> I quickly found out that each word got sent on individual lines. I changed to CR so I send "blocks" of words per se. If you treat it like a type ahead buffer style, it seems to be OK that way.

Waiting for the ARQ capability. I'm used to that with Pactor. I do like Rick's work.

Regards to all,

I just observed the following that indicates a problem with the sending station (KD4JRX) The problem is due to short term frequency instability. This can be seen in the cyclic nature of the Decode quality plot below. Normally it should be a fairly straight line with random disturbance...The cyclic nature indicates the transmitter is drifting several Hz between each sync character and then the DSP software retunes during the sync times. Without knowing the transmitter my guess is either it is an old unit or perhaps has a marginal DC power source. This can't be fixed easily in the software without inserting many more sync characters and slowing down the throughput substantially. (Now there is a sync character every 7 characters or about 1 per second). Such a transmitter would likely also have very significant problems trying to do PSK or QAM modes. I haven't seen this yet and it looks to be rare but it might be good to know what the transmitter is or to pin it down to a drooping power supply.

Pete,

I understand you are not using a Flex Radio but you are using Flex Radio or HDSDR SW! PWSDR (Power Software Designed Radio) is the actual name of the software you reference as PSDR.

In the PWSDR SW, under “CAT Control,” there are two settings you need to invoke. One is labeled “CAT Control” which once connected to the Chat program will allow the chat program to follow your radios frequency setting. The second setting is “PTT Control” which provides for transmit receive control. I’m not at my radio but as I recall, I use both RTS and DTR. I guess the simple solution here is to initially try both and if this works, great. If not, try one and then the other. As far as the Chat program setting, I followed the help file for Flex Radio and this seems to work FB. You can set the ID as either Kenwood or Flex Radio. Both follow the same protocol.

Let me know if you are still having a problem. If so, what I can do, using TeamViewer, is connect directly to your computer and make the changes for you. I frequently do this for others and most of the time, fix the problem/s.

From: Rick Muething
Topic: 3485 Message: 3495

All,

I made a quick test version to use a DSP technique called a Quinn spectrum interpolator that allows fairly accurate FFT bin interpolation and use that to log the estimated frequency offsets during the decode. Here are two sessions each about 1 second long which shows the problems observed on a few stations.

This first one is a good solid decode. A “soft” distance of 1.16 average for the 7 characters. (A perfect soft decode ...never happens! would be a distance of 0. 1 is very good. You start picking up errors in the range of 2-3. Note that the estimated drift from the initial tuning on the right. The Quinn estimator is probably only good to about 2 Hz the way I used it here. Still these track fairly well.

2013/10/23 18:18:54.36 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 1 = .26 Hz
2013/10/23 18:18:54.48 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 2 = 2.36 Hz
2013/10/23 18:18:54.62 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 3 = 1.32 Hz
2013/10/23 18:18:54.73 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 4 = 3.27 Hz
2013/10/23 18:18:54.87 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 5 = 6.28 Hz
2013/10/23 18:18:54.98 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 6 = .64 Hz
2013/10/23 18:18:55.15 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 7 = -1.12 Hz
2013/10/23 18:18:55.16 [0.1.6.1] [ProcessNewSamples] Avg Distance for 7 characters = 1.16 Go to TRACK state.

Now compare a similar 1 second group of 7 characters on a station showing a cyclic (sawtooth like) decode quality. Note the initial offset is good (this is the first character seen after the DSP tune. But see the large errors in the 4th 5th and 6th characters...up to 1/2 bin (a bin is = to the baud rate or 46.875 Hz). This is quite a large shift and shows a 15 Hz shift over just 250 ms ....Not very good stability. I suspect it may have to do with the power supply to the radio

2013/10/23 19:21:19.92 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 1 = 1.76 Hz
2013/10/23 19:21:20.03 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 2 = .94 Hz
2013/10/23 19:21:20.17 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 3 = -3.52 Hz
2013/10/23 19:21:20.28 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 4 = -5.70 Hz
2013/10/23 19:21:20.42 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol

on Character 5 = -19.23 Hz
2013/10/23 19:21:20.53 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 6 = -20.09 Hz
2013/10/23 19:21:20.67 [0.1.6.1] [MixDecode8Bitcharacter] Estimated Drift of last symbol on Character 7 = 3.13 Hz
2013/10/23 19:21:20.68 [0.1.6.1] [ProcessNewSamples] Avg Distance for 7 characters = 1.98
Go to TRACK state.

Although there is some trending the measurements are difficult to make rapidly and apply dynamically for correction. It doesn't look like a smooth drift over the 1 second frame time and that make compensation or correction much more difficult (and CPU intensive).

Just an observation for now...keep your eye out for this and see if it seems to track specific stations and what might be the main cause of this.

Oh well if it were easy everyone would do it!

73,

Rick KN6KB

Hi Michael,

I don`t want to criticize you, it was just a recommendation for usage
and a note to IARU regulations. I think that you will get more
"listeners" too, if you transmit above 10140 kHz. And interfering with
CW stations will be minimized. That could be a win-win-situation for
both, CWists and the digital ops.

I wish you success with your experiments and maybe we'll met in V4chat;
I often listen at 10143 kHz for various modes. The last autumn storm has
damaged my coax connector at the T2FD antenna, but I am hopefully to fix
it asap.

Tom,

Above 10140 is in the auto forward sub band normally allocated to wideband (> 500 Hz modes). In the US wideband modes MUST be in the 10140 to 10150 range. Pactor and WINMOR stations routinely use the area 10120 and up (500 Hz modes 10120 to 10140) 2100 Hz bandwidth 10140-10150.

We are doing some preliminary testing of this new mode and of course can use other frequencies though no one owns any specific frequency.we tried to move above 10120 to leave the bottom 20 Khz for pure CW.

Subject: [V4Protocol] 10.123 VChat IARU not for region 1

VChat use 200HzBW = Narrow band it is write in the users guide.
Digimodes is BW over 500Hz
Narrow band is BW inside 500Hz
I see on yahoo groupe the activity VChat is on 10.123
CW have 10.100 to 10.140 I think for experimental mode have a place to 200hz on this segment .
OK dear DF5JL I stop all transmission below 10.140, you have WSPR JT65A JT9 below 10.140 I think you may contact this groups to advertise they are in illegality, it is fun that LotW (ARRL) confirm the QSO, not in CW, made on this bad band ??
thanks for your infos 73

Hello rick

What I have here is:

During transmit the soft should NOT do anything via usb port (polling frequency or something like that)

The polling (here on my setup) gives some slight audio background noise (that adds to the transmitted signal!!!!!)

So ... the poll should be "paused" during a transmit session ...

Only at start or end of a transmit session the port can be polled once (if needed for setting ptt via cat for any radio that has cat ptt instead of hard wired ptt)

That should give clean transmit audio

Your soft polls every few seconds (iirr 3 seconds?!?)

Can that be "paused" during transmitting?!?

....

Greetz

3499. New Chat ops With v0.1.6.0

Yahoo group: V4Protocol
Date: 2013-10-24 00:12:54 UTC
From: W6IDS
Topic: 3474 Message: 3499

I did my install of the newly released v0.1.6.0 yesterday. Got it up and running. In looking around, I see where there are some 10 Mhz ops taking place, including some beacon activity. I don't have a 10 Mhz antenna at the moment, so I initially came up on 14073.000 with my LPDA at 50 ft and VOILA! Made some contacts.

Is anyone running 7 Mhz with Chat? Anyone ever try? Not sure what the path might be like.

I read where Dave K3GAU is hanging out on anywhere between 3584 and around 3587 in the evenings. Jeez, I have a reason now to fix my 80 meter wire that got torn down by a B I G tree limb a couple of months back.

10 m been open the few days. I only get a chance to do 30 m during the day.
I only pick up a local ham from Victoria.
What would be a good 10 m spot to use as we could get Hams with VHF and 10
m credentials. Just a thought.

That might make for a reasonable topic of discussion.
Personally, I'd think it's wide open, wouldn't it be? At
least there's a wider piece of real estate up there per
se.

Hmmm. . . . a ten meter radio, parked on 10m with a
Chat beacon, available to connect when possible.

So, say again what your experience has been on 10
and about that Victoria Ham? I know you mentioned
daytime 30 meters but what is your thinking about
10 meters?

Just for grins, at 0115Z, I moved down to 7061.000
with the Chat from 14073.000.

I have an LPDA that I'm using for 20 – 10 meters at
this station. I was wondering if I should look to a
vertical antenna for some of this specific purpose
operation, especially for 10 meters.

Yes, seems 10 meters is showing signs of life lately, Finally, I might add. What about using 28.223 Mhz? On 30M we're using 10.123 but I think 28.123 would be in conflict with other traffic on 10 meters. But I almost never hear anything around the 28.223 mark. Thoughts or ideas?

3503. RE: [V4Protocol] RE: SDR/PSDR

Yahoo group: V4Protocol
Date: 2013-10-24 01:43:54 UTC
From: Pete Ferrand
Topic: 3471 Message: 3503

Kirk:

Strange. In the seven years I've been using PowerSDR and two or three of its forks as part of my station I have never seen it referred to as PWSDR. The "W" doesn't stand for a word :)

I have subscribed to the softrock40 Yahoo group almost since the start...searching the eight years of the mail list I just counted 49 references to PWSDR, and 3800 references to PSDR.

Currently as I've said I'm using GSDR, the Genesis version.

I take it from what you say that Rick's program does not produce a PTT CAT command, unlike Fldigi and all my other digital programs. I must use the separate PTT function of GSDR.

So the remaining question is, does one have to use the Eterlogic serial port program as Rick's help suggests or does vspMgr work? vspMgr works with everything else and I'm not crazy about maintaining two port emulators on the same computer.

Subject: RE: [V4Protocol] RE: SDR/PSDR

Pete, I understand you are not using a Flex Radio but you are using Flex Radio or HDSDR SW! PWSDR (Power Software Designed Radio) is the actual name of the software you reference as PSDR.In the PWSDR SW, under “CAT Control,” there are two settings you need to invoke. One is labeled “CAT Control” which once connected to the Chat program will allow the chat program to follow your radios frequency setting. The second setting is “PTT Control” which provides for transmit receive control. I’m not at my radio but as I recall, I use both RTS and DTR. I guess the simple solution here is to initially try both and if this works, great. If not, try one and then the other. As far as the Chat program setting, I followed the help file for Flex Radio and this seems to work FB. You can set the ID as either Kenwood or Flex Radio. Both follow the same protocol. Let me know if you are still having a problem. If so, what I can do, using TeamViewer, is connect directly to your computer and make the changes for you. I frequently do this for others and most of the time, fix the problem/s. 73, Kirk, K6KAR From: V4Protocol@yahoogroups.com

Subject: Re: [V4Protocol] RE: SDR/PSDR

Hi Kirk:

Thanks for the reply. Couple more specific questions, then:

What is PWSDR?

Does the CAT Control function not work for COM port CAT? It performs PTT with Fldigi, HRD, FreeDV, etc. when paired with vspMgr 1.0.3 and VAC 4.9.

If I set it up for PTT Control, what do you set the RTS/DTR to? What do you set the ID as?

Also, I'm only looking for PTT here, this radio setup cannot be tuned by computer.

Thanks.

Pete,

Yes, I have used both my 3000 and 5000 without difficulty. You obviously have paired your PTT with another com port. Use this com port as your PTT control. Also,, (in PWSDR), be sure to set delay time to 0ms. If you need further assistance, look me up on QRZ.com, drop me an email and we can set up a time where I can either call you on the phone or use Skype. My Skype address is k6kar1

73,
Kirk, K6KAR.

---In v4protocol@yahoogroups.com, wrote:

Pete,

I can’t get set up right now for a test on the Flex (I have a Flex 3000 available but no time!). But I would suggest you try the help in the Chat (File, Help Index, Flex SDR radios). That section was “lifted” from the prior V4 Chat help file which was verified and should still work about the same. If it works (or you find a problem or get a configuration that works) let me know and I’ll update the help on the next Rev.

Hi Rick,

I can understand your hesitation to want to piggy back onto some other software that is actually doing the rig control. I was just thinking about this very subject with regard to the logging software in DXLabs, the DXKeeper. I know this is not on the priority list for now, but in the design stages it might be handy to have a hook for linking the logging to DXKeeper. I know MultiPSK, MMSSTV and fldigi have this and it works great. They all also have a gateway link to DXLabs Commander. While I have only used MultiPSK in ALE 400 ARQ once in this configuration, it did seem to function.

Not that I am trying to make the project more cumbersome or complex, how much headroom would it take for the ARQ algorithm to determine latency and adjust accordingly and dynamically? Then for those that need or want to use another system that actually does the rig interface, HAM4 can adjust as needed.

Again, just something to think about for both the logging and rig control. In any respect, please keep up the nice work.

Doug N3JXB

---In V4Protocol@yahoogroups.com, <v4protocol@yahoogroups.com> wrote:

Dave,

I'll take out the Kenwood commands that turn off the Noise blanker, Noise Reducer and Beat Canceller. Those shouldn't be needed (it will just leave the radio as is) but will probably be OK if left active (it's hard to predict what some of these DSP based "filters" will do to the signal but 4FSK is more tolerant than PSK or QAM modes). In general Radio DSP functions like noise blankers and DSP notches add distortion and unpredictability to the received waveform of digital modes that can't be easily undone. The tight audio filters and Goertzel tone decoders using in the H4 TNC should be all the digital "filtering" that is necessary.

The beep you hear is the result from a command from Chat to read the radio dial. Basically the radio gives a beep every time it receives a command (usually the default setting of the radio) but you can usually turn it off in a menu of the radio. It is similar radio control code to RMS Express but there are some differences (e.g. RMS Express doesn't read back the radio dial or support "click-to-tune" like Chat does).

I generally don't like trying to "piggy back" on existing 3rd party control interfaces or software. Some of these (e.g. Ham radio deluxe etc. not sure about Hamlab) introduce significant delays (due to software polling) and that can cause serious degradation and variation on Transmit > Receive latency which is critical on ARQ modes. Any delay or uncertainty in the T>R or R>T timing ends up requiring larger timing margins and can significantly affect ARQ net throughput and reliability.

73 and thanks for the feedback,

Rick KN6KB

3505. Re: [V4Protocol] New Chat ops With v0.1.6.0

Yahoo group: V4Protocol

From: W6IDS
Topic: 3474 Message: 3505

The 28.223 seems reasonable, considering this is all planning and discussion. How many folks are in the forum who “actively” use the Chat mode and can work 10 meters?

Was wondering, what other activity would be interfered with at 28123.000? I ask because of the pretty sparse “openings” at my location. I mean, there’s random activity of sorts, around 14073.000 that I’ve noticed. Most never within the band pass display. If it is, I just wait until it’s clear. Surely it can’t be “regular” activity on 10 meters, what with the sparseness of openings.

Just thinking is all. . . .nothing wrong with your idea at all as far as I’m concerned for the moment.

I did my install of the newly released v0.1.6.0 yesterday. Got it up and

running. In looking around, I see where there are some 10 Mhz ops taking place, including some beacon activity. I don’t have a 10 Mhz antenna at the moment, so I initially came up on 14073.000 with my LPDA at 50 ft and VOILA! Made some contacts.

Is anyone running 7 Mhz with Chat? Anyone ever try? Not sure what the path might be like.

I read where Dave K3GAU is hanging out on anywhere between 3584 and around 3587 in the evenings. Jeez, I have a reason now to fix my 80 meter wire that got torn down by a B I G tree limb a couple of months back.

Doug,

Thanks for your comments. I already have a ADIF log generator in the Chat program and it generates a log in standard ADIF format which can be read and processed by many ADIF logging programs. It is easy to tweak just what is written for each connect (Date, Time, Call signs, frequency etc.) But I don't want to focus on that yet until we get the actual decoding optimized and the ARQ working. I want to stick with a standardized and controlled format like ADIF…otherwise you are constantly chasing a moving (and undisciplined) target.

With respect for latency calculations…the problem is when you introduce a variable such as a delay induced by the keying program it is not a simple delay…say 100 ms it is a variable more like 30 to 170 ms (due to OS time slicing and timer resolution within the software (hard to control too if it is third party!). So now you have to build in margins for the latency to cover that as well. There was in V4 and will also be in this version some compensation for measuring the initial "round trip" response….e.g. the delay from when the transmitting station ends the frame until he receives the ACK from the remote end. This is fairly easy to measure but is subject to many factors that are not constant so require significant margins…e.g. If I measure the round trip say at 500 ms I would have to design the ARQ timing to probably work over a range of 400 to 600 or more to accommodate. If there is another third party radio control program in that loop you could easily add another 100 – 200 ms guard band…. Making it say 200 to 800 ms. That may not sound like much but it adds up…and in ARQ you are easily talking about maybe 30- 40% throughput impact. So yes compensation can (and is used in some spots) but allowing very sloppy timing ends up in a protocol that is sluggish and always runs at a much slower rate than what is possible ….You would be amazed at all the work that goes into squeezing out a few percent throughput…it all adds up. Compare this for example to Pactor that has a maximum response delay of something like 50 ms. (its all hardware controlled).

The first part of a good ARQ protocol is to insure robustness and bullet proof IRS <> ISS exchange…not at all trivial …I have written 3 or 4 protocols. The time to get this right is AFTER all the major bugs and tuning tweaks are done in the FEC protocol.

Thanks for your comments and interest.

Hi Rick,

I can understand your hesitation to want to piggy back onto some other software that is actually doing the rig control. I was just thinking about this very subject with regard to the logging software in DXLabs, the DXKeeper. I know this is not on the priority list for now, but in the design stages it might be handy to have a hook for linking the logging to DXKeeper. I know MultiPSK, MMSSTV and fldigi have this and it works great. They all also have a gateway link to DXLabs Commander. While I have only used MultiPSK in ALE 400 ARQ once in this configuration, it did seem to function.

Not that I am trying to make the project more cumbersome or complex, how much headroom would it take for the ARQ algorithm to determine latency and adjust accordingly and dynamically? Then for those that need or want to use another system that actually does the rig interface, HAM4 can adjust as needed.

Again, just something to think about for both the logging and rig control. In any respect, please keep up the nice work.

---In V4Protocol@yahoogroups.com, <v4protocol@yahoogroups.com> wrote:

Dave,

I'll take out the Kenwood commands that turn off the Noise blanker, Noise Reducer and Beat Canceller. Those shouldn't be needed (it will just leave the radio as is) but will probably be OK if left active (it's hard to predict what some of these DSP based "filters" will do to the signal but 4FSK is more tolerant than PSK or QAM modes). In general Radio DSP functions like noise blankers and DSP notches add distortion and unpredictability to the received waveform of digital modes that can't be easily undone. The tight audio filters and Goertzel tone decoders using in the H4 TNC should be all the digital "filtering" that is necessary.

The beep you hear is the result from a command from Chat to read the radio dial. Basically the radio gives a beep every time it receives a command (usually the default setting of the radio) but you can usually turn it off in a menu of the radio. It is similar radio control code to RMS Express but there are some differences (e.g. RMS Express doesn't read back the radio dial or support "click-to-tune" like Chat does).

I generally don't like trying to "piggy back" on existing 3rd party control interfaces or software. Some of these (e.g. Ham radio deluxe etc. not sure about Hamlab) introduce significant delays (due to software polling) and that can cause serious degradation and variation on Transmit > Receive latency which is critical on ARQ modes. Any delay or uncertainty in the T>R or R>T timing ends up requiring larger timing margins and can significantly affect ARQ net throughput and reliability.

73 and thanks for the feedback,

Rick KN6KB

Siegfried,

Well you have to remember that now there are several (I think 5 or 6 at my last count) of Radios that use the same USB port for both Sound card (internal USB sound card) and radio control You have to continually read the sound card data from the USB port it is the best way to get the audio for DSP. These radios (I have specific experience and tested at least 3 models) have excellent USB sound cards (sampling rate error typically < 200 ppm, few artifacts, good RF isolation.) Since the USB sound card can be added to the radio during design for a few $ per radio these will become more prolific now primarily all the new HF radios from Kenwood and Icom).

During transmit the only command to the radio is PTT on and PTT off (for those installations using CAT PTT control). I□ll check and make sure that is what is happening if it is not it is easy to fix. During receive it is necessary to continuously poll to pick up dial changes made by the user.

Hello rick

What I have here is:

During transmit the soft should NOT do anything via usb port (polling frequency or something like that)

The polling (here on my setup) gives some slight audio background noise (that adds to the transmitted signal!!!!!)

So ... the poll should be "paused" during a transmit session ...

Only at start or end of a transmit session the port can be polled once (if needed for setting ptt via cat for any radio that has cat ptt instead of hard wired ptt)

That should give clean transmit audio

Your soft polls every few seconds (iirr 3 seconds?!?)

Can that be "paused" during transmitting?!?

....

3508. Re: Observations

Yahoo group: V4Protocol
Date: 2013-10-24 13:11:41 UTC
From: Rick Muething
Topic: 3508 Message: 3508

All,

I am running a special version here of the H4TNC with additional logging to acquire some data on the issue of apparent drift on SOME signals seen yesterday. I have to leave for the AirPort this afternoon (Thurs) so if you can connect before about 1 PM EDT I MAY be able to get a fix posted but at least will have some data to work with. If possible please repeat your call sign several times and possibly a short description of your Radio and sound card setup. My hunch is this may have more to do with the sound cards (sampling rate accuracy) than the radios and the log should confirm this or not and how much correction is possible.

I have some ideas that may be able to compensate for these observed decode issues and improve decoding accuracy even in normal cases(at the expense of some additional CPU DSP loading) but I need some real world data. In doing my own "across the desk RF" tests between a Kenwood TS-590S and an Icom 7100 (both with built in USB sound cards) my decoding distance, frequency drift, and sample rate errors are too low to give any useful data. (a good argument for using these kinds of radios in digital work! They make setup not only one cable "plug and play" but their sample rate error and RF/Audio isolation are superior to any external ham "sound cards/interfaces" I have tested.)

I will still be running the beacon and monitoring on 10123.00 today until about 1 PM EDT

Thanks and 73,

Rick KN6KB

Rick,

I don't know if it adds anything to the discussion or not but KB8X and I had an hour and half QSO using CHAT on 80 meters last night and there were only a couple of missed characters during the whole QSO. We are 75 miles apart. The signals were strong and stable.

3513. Sending a Test w/ASCII

Yahoo group: V4Protocol
Date: 2013-10-24 20:03:12 UTC
From: W6IDS
Topic: 3511 Message: 3513

I just noticed that when I manually send an ASCII(7bit) test it “peters out” sort of like –0

W6IDS: ASCII(7bit): The quick brown fox jumped ovg56789

W6IDS: ASCII(7bit): The quick brown fox jumped oog’s b9

My Beacon just activated and it, too, faltered -

DE W6IDS Howard EM7DA QYtx instead of

DE W6IDS Howard EM79NV 20mn Ant-LPDA PWR-50W

Now then, when the transmission stops, there is still an attempt to continue to display the transmission but it’s just a few garbled letters but nothing more.

Anyone?

Howard W6IDS

Icom 7600 7100 7200

Last two new kenwood HF rigs, just can't remember the models.

I am an Icom guy.

Howard all we need is some sort of agreement. On 28123 or 28223??

If you notice HFN log. You will see HFN pilot station from EU connecting to NA on 10 m. I know the bands open. I can connect to wa4zko-4 on his robust packet node pretty much during the day. I know it can cover NA plus with Vchat.

As soon I see a freq agreed to I'll park there. 30 doesn't do it till the pm out here in BC

From: <la7um@...>
Topic: 3485 Message: 3517

Tom. I think we need working or thinking a bit long term. In my oppinion it is just for a while that the actual museum mode CW in Reg 1 occupy alone such a great part of the band.

When the narrow part between LW and MW was opened for HAMS it was CW only, at least in Norway, but now narrow band digi modes are also allowed. CW will inevitably be one mode amongs others.

The HAMS cannot contribute ANYTHING to CW. It has been used for 100 years by professionals. Future is digital. Narrow Digital modes are interesting. HERE HAMS can contribute, and make a reason for getting allocations of spectrum in the future.

CW alone in our century will be the death of HAM radio, but should always be the really "sport mode" where operator skill is in focus.

We need to switch from museum guards to development spear heads again, like hams was hundred years ago.

We need helping the IARU negotiators from the different countries with good arguments for preparing the international conferences and make good unanimous allocations.

73. Finn/LA7UM

---In v4protocol@yahoogroups.com, <rmuething@...> wrote:

Tom,

Above 10140 is in the auto forward sub band normally allocated to wideband (> 500 Hz modes). In the US wideband modes MUST be in the 10140 to 10150 range. Pactor and WINMOR stations routinely use the area 10120 and up (500 Hz modes 10120 to 10140) 2100 Hz bandwidth 10140-10150.

We are doing some preliminary testing of this new mode and of course can use other frequencies though no one owns any specific frequency…we tried to move above 10120 to leave the bottom 20 Khz for pure CW.

Subject: [V4Protocol] 10.123 VChat IARU not for region 1

VChat use 200HzBW = Narrow band it is write in the users guide.
Digimodes is BW over 500Hz
Narrow band is BW inside 500Hz

I see on yahoo groupe the activity VChat is on 10.123
CW have 10.100 to 10.140 I think for experimental mode have a place to 200hz on this segment .
OK dear DF5JL I stop all transmission below 10.140, you have WSPR JT65A JT9 below 10.140 I think you may contact this groups to advertise they are in illegality, it is fun that LotW (ARRL) confirm the QSO, not in CW, made on this bad band ??
thanks for your infos 73

From: Robin Hodgson
Topic: 3485 Message: 3523

Finn,
Many of us are aware that the problem here is caused by the IARU itself,

1. The fact that IARU permits HF bandplans to be different by region is ridiculous.
HF signals travel world wide. Amateur radio HF bandplans should be global.
The IARU regional differences, particularly on 30 meters, are a source of much
irritation both to hams and to the regulatory authorities in different countries.

2. The IARU region 1 proposal to allocate bandwidth occupancy rather than modes,
was a valiant attempt, which would have resolved the issues you mention.
Unfortunately, the proposal was not fully accepted (objections from the vociferous
CW community). The result is that today on 30 meters, only 20% of 10.100 - 10.150 MHz
allowed by the ITU is available for digital modes or experimentation (10.140 - 10.150 MHz).
That is, in region 1, 80% is for CW (morse code) only.

Finn, as you say, the only way this can change is if the IARU representatives in each
country
take action and insist that this organization should understand and support future
technologies, even if it means de-emphasising such antiques as CW, AM and RTTY.
As far as I am aware, there are no plans to even discuss the matter in the IARU or any of
its regions.
For those among us who feel strongly, we actively need to lobby our IARU representatives.

Subject: RE: AW: RE: [V4Protocol] Beacon/CQ of F1ABL

Tom. I think we need working or thinking a bit long term. In my oppinion it is just for a
while that the actual museum mode CW in Reg 1 occupy alone such a great part of the band.

When the narrow part between LW and MW was opened for HAMS it was CW only, at least in
Norway, but now narrow band digi modes are also allowed. CW will inevitably be one mode
amongs others.
The HAMS cannot contribute ANYTHING to CW. It has been used for 100 years by professionals.
Future is digital. Narrow Digital modes are interesting. HERE HAMS can contribute, and make
a reason for getting allocations of spectrum in the future.
CW alone in our century will be the death of HAM radio, but should always be the really
"sport mode" where operator skill is in focus.
We need to switch from museum guards to development spear heads again, like hams was
hundred years ago.
We need helping the IARU negotiators from the different countries with good arguments for
preparing the international conferences and make good unanimous allocations.
73. Finn/LA7UM

---In v4protocol@yahoogroups.com, <rmuething@...> wrote:

Tom, Above 10140 is in the auto forward sub band normally allocated to wideband (> 500 Hz modes). In the US wideband modes MUST be in the 10140 to 10150 range. Pactor and WINMOR stations routinely use the area 10120 and up (500 Hz modes 10120 to 10140) 2100 Hz bandwidth 10140-10150. We are doing some preliminary testing of this new mode and of course can use other frequencies though no one owns any specific frequency…we tried to move above 10120 to leave the bottom 20 Khz for pure CW. 73, Rick KN6KB From: V4Protocol@yahoogroups.com [mailto:V4Protocol@yahoogroups.com] On Behalf Of MICHEL F1ABL

To: V4Chat V4 Yahoo
Subject: [V4Protocol] 10.123 VChat IARU not for region 1 VChat use 200HzBW = Narrow band it is write in the users guide.
Digimodes is BW over 500Hz
Narrow band is BW inside 500Hz
I see on yahoo groupe the activity VChat is on 10.123
CW have 10.100 to 10.140 I think for experimental mode have a place to 200hz on this segment .
OK dear DF5JL I stop all transmission below 10.140, you have WSPR JT65A JT9 below 10.140 I think you may contact this groups to advertise they are in illegality, it is fun that LotW (ARRL) confirm the QSO, not in CW, made on this bad band ??
thanks for your infos 73To: V4Protocol@yahoogroups.com

Subject: AW: RE: [V4Protocol] Beacon/CQ of F1ABL

Hi Michael,

why a V4Chat beacon in the cw portion of the 30-m-band and not above 10140 kHz (digimodes)?

I would suggest everyone try http://obriensweb.com/sked http://obriensweb.com/sked to mark the frequency you are operating on. I am not affiliated with this site but it will be handy to try and organize contacts on different bands.

If anyone knows of another site for setting up a schedule please share it.

I would suggest everyone try http://obriensweb.com/sked to mark the frequency you are operating on. I am not affiliated with this site but it will be handy to try and organize contacts on different bands.

If anyone knows of another site for setting up a schedule please share it.

Hi Doug,

There is another reporting/chat/scheduling site for MFSK (which I guess includes H4FSK FEC) on Hamspots.org.
Problem is that not many people are aware of it or use it. Personally, I am using Hamspots regularly for other
activities, so it is no bother to look at the MFSK section. It also has a section for ARQ, so whenever H4FSK is
ready for testing ARQ, that is available. Otherwise, Andy O'Brien provides a good resource.

GA Michel,

A few minutes ago I saw your signal on 28123 KHz. Unfortunately I didn't have the time to try and work you. Your signal was up and down quite a bit (QSB) and sometimes it either didn't decode or only partly decode.

Here we go again - but since ARRL 'suggests' we use the following:
10 Meters (28-29.7 MHz)
28.000-28.070 CW
28.070-28.150 RTTY
28.150-28.190 CW
28.200-28.300 Beacons

My 10 meter beacon will be on 28.230 today, Saturday, October 26th. Hope to see you there when the band opens.

So by virtue of the above list, for ARQ and FEC QSO we would be between 28.070 and 28.150. I imagine the ARRL/FCC expects that region to be digital data. Obviously there is PSK and Olivia mixed in there as well.

I just started a beacon on 28.230, 25 watts. But there is a lot of voice activity close to the frequency. In the states we are not permitted to use voice below 28.300 so I wonder if this is bootleg SSB.

Either way, I will be checking periodically. Hope to see some activity on 28.230.

John,

I think the status in the capture box will be offline until a signal breaks the squelch. If you lower the squelch setting the idle status should change. When I first saw the offline status I thought that I was having sound card problems.

I also think that the status for playback will change when you send a signal out.

3569. Sound Card Sample rate checker

Yahoo group: V4Protocol
Date: 2013-10-26 20:13:29 UTC
From: Rick Muething
Topic: 3566 Message: 3569
Attachments: 1 described; binary payloads are missing from this source WARC

All,

Here in LA. No radio equipment so can't participate in any over the air testing.

I have investigated some of the decoding problems observed showing a cycling of the decode quality which look something like this:

I am now pretty convinced this is due to some significant errors in the sound card capture or Playback rate. The current beta software should have enough correction capability to handle up to +/- 1000 ppm (.1%) error but the above type of distortion seen in some cases is something more like 10,000 ppm or 1% .Pretty bad for even a cheap sound card
I have uploaded a utility program found in the MixW software package called CheckSR.exe to the V4Protocol FTP section. If you download this simple utility you can check the accuracy of your sound card.
I would suggest if you are seeing results like the above or others have reported seeing your signal like this then run the simple CheckSR.exe program.
To run select 12000 Hz sample rate (that is what is used on the H4Chat program. Start it and let it run at least a minute or more. Stop and look at the errors reported in ppm. If they are over 1000 the sound card is suspect. If you see over 1000 on the capture rate try another test at 48000 and see how it compares to the first test. (normally 48000 and 12000 are more "cardinal" rates which have been shown in many tests to have the lowest errors on most sound cards).
There are some ways to compensate for this error in the software (the "calibration" is really just a compensation in the H4TNC DSP code) and I am evaluating some different ways.
If you have a sound card or sound card interface that is over 1000 ppm please report it to the reflector along with the sound card type so we have some idea of what percentage of those with problems we have.
Just for reference: The SCS PTC II and DR7xxx DSP TNC have a very stable temperature compensated Xtal oscillator that is better than 10 ppm. This is what is required for really high performance DSP. Some tests I have done on the built in sound cards on the newer radios (Kenwood TS-590, Icom 7100, 7200, 7600) have been very good too...< 100 ppm.

3575. Blips in Power Out on FEC

Yahoo group: V4Protocol
Date: 2013-10-26 23:39:51 UTC
From: <esunetdude@...>
Topic: 3575 Message: 3575

I noticed that when sending text in HAM4 the output power goes to whatever level I set an then repeatedly has sharp but brief drops about every 1 1/2 seconds. The power dip is so sharp the I can even see it on the amp meter on the power supply. I do not see this with the FSKID. And I have checked the older V4CHAT and this does not happen. Is there some repeated cycling that would cause this in HAM4? Is anyone else noticing this?

For what it is worth, I have an Icom 7600 and I am using the USB interface.

Doug, N3JXB

At least in my case, CheckSR gives very inaccurate results when used with a SignaLink USB.

With a rate of 48000 selected: CheckSR reports my SignaLink has an input rate of 46044.45 and an output of 46010.02. Off by almost 2000 Hz.

Using Flidgi's WWV sound card calibration, the SignaLink is only off from 48000 by 47 ppm. And the 47 ppm adjustment works in Flidgi.

Hi Rick,

I ran the CheckSR program on my Kenwood TS-590 with its built in sound card. The difference PPM was 0, both input and output.

When I see this kind of decoding problems I just take it for granted that it's just poor propagation.

Hi Rick,

I used the CheckSR.exe against the internal USB soundcard in my Icom 7600 and the external SignaLink USB. The numbers just jumped all over, but neither was over 144. Then, without making any changes I checked both with fldigi using its WWV check. Using an adjustment of 0 for both sound inputs produced a straight line. I hope that small contribution will help.

I am, however, still puzzled by the very obvious dips in output when running FEC. This is not evident with the FSKID, just FEC text and the beacon.

I have investigated some of the decoding problems observed showing a cycling of the decode quality which look something like this:

I am now pretty convinced this is due to some significant errors in the sound card capture or Playback rate. The current beta software should have enough correction capability to handle up to +/- 1000 ppm (.1%) error but the above type of distortion seen in some cases is something more like 10,000 ppm or 1% .Pretty bad for even a cheap sound card
I have uploaded a utility program found in the MixW software package called CheckSR.exe to the V4Protocol FTP section. If you download this simple utility you can check the accuracy of your sound card.
I would suggest if you are seeing results like the above or others have reported seeing your signal like this then run the simple CheckSR.exe program.
To run select 12000 Hz sample rate (that is what is used on the H4Chat program. Start it and let it run at least a minute or more. Stop and look at the errors reported in ppm. If they are over 1000 the sound card is suspect. If you see over 1000 on the capture rate try another test at 48000 and see how it compares to the first test. (normally 48000 and 12000 are more “cardinal” rates which have been shown in many tests to have the lowest errors on most sound cards).
There are some ways to compensate for this error in the software (the “calibration” is really just a compensation in the H4TNC DSP code) and I am evaluating some different ways. If you have a sound card or sound card interface that is over 1000 ppm please report it to the reflector along with the sound card type so we have some idea of what percentage of those with problems we have.
Just for reference: The SCS PTC II and DR7xxx DSP TNC have a very stable temperature compensated Xtal oscillator that is better than 10 ppm. This is what is required for really high performance DSP. Some tests I have done on the built in sound cards on the newer radios (Kenwood TS-590, Icom 7100, 7200, 7600) have been very good too...< 100 ppm.

Sound blaster is an excellent card for digital modes; got two of them. KJ1j and I had qso about 12 cst. 28.230 worked fine, heard no beacons.

After using CHECKSR for several years, I have found that the samplerate of the soundcard is determined in reference to the time base of the computer. So the card is usually very good unless the time base of the computer is poor. You can take the same soundcard and use it with two different computers and get two different results.
My two radio computers (one WIN7, AMD ATHLON II X4 650 GHz w/8 Gig RAM) routinely gives much better results from CHECKSR. The other (XP CELERON 440 - 2GHz w/1 Gig RAM) is not so stable. My SL on the WIN7 shows a +31 PPM Input, and + 37 PPM Output error. My XP shows the same SL with -97 PPM Input and -101 PPM Output error.
The clock on the Win7 machine will normally run several days with the clock varying only a very few seconds. The XP will run the same time, but the clock error will be many seconds, maybe even close to a minute.
This stability is shown when running M110A (MARS, not legal on Ham bands) the XP will lose sync much sooner than the more stable WIN7 one.
So, don't be in a hurry to blame the soundcard itself.
As a contradiction, my XP machine seems to decode H4Chat much better than the WIN7.. Go figure..

Over the weekend I experimented with my external soundcard (a Soundblaster X-Fi go pro) and found that if I deleted all the Creative Sound Labs software/drivers and started using the generic microsoft driver from 2001 (old XP Pro computer) all of my problems disappeared! Before I was seeing the Decode Quality display on beacon transmit and QBF cycling up and down--now I see a solid green line with perfect decode. CheckSR is showing (at 44100 sample rate) -51 Input and -76 Output.

I discovered the possible source of the problem while researching HF ALE software PCALE, the developer said there were numerous problems relating to driver software in his application.

Beaconing 28.230 for a few hours today.

Hoby,

If you read about he utility program CheckSR.exe you will find that it uses the computer time of day clock for the reference interval. (if you are going to count the number of samples per second ...actually averaged over MANY seconds... you MUST have some absolute reference for the “second” and that is when the computer clock is used. In virtually any computer the time of day computer clock is not the same reference used for the sound card. So the bottom line is you can expect normal variations from the same sound card across different computers due to their non perfect time-of-day reference clocks. The instructions suggests these variations (due to computer clock) are in the range of +/- 100 ppm or less (that would be on the order of a 10 sec/day real time clock error.

What the CheckSR does is measure the actual sample rate of the sound card (by counting the number of samples in a given period of seconds) . There are two major problems seen on sound cards...especially low cost ones:
1) All the rates are off by approximately the same ppm. This is due to error in the sound card’s reference oscillator...Some you cheap $.25 “xtals” with poor frequency tolerance and high drift. Errors of +/- 2000 ppm are not that uncommon. (as a contrary example the sample rate reference in the SCS PTC II and similar DSP TNCs is on the order of +/- 10 ppm or better)

2) Some sound card chips use logic to approximate the sound card sample rate on some settings. On these you may find the cardinal settings like 96000, 48000 etc. Very good (say < 200 ppm) but some of the other rates (especially 44.1KHz 11.025, 8 KHz) to have much larger errors say +/- 2000 ppm or more. This is not due to the xtal frequency but to approximations in the reference generator mechanism. For playing a song you would probably never notice 2000 ppm error but when it comes to demodulating certain modulation types using DSP it is a BIG error and depending on the modulation scheme and number of carriers used and their spacing NOT easily corrected (e.g. with a reasonable amount of CPU resources) by software.

Thanks for the feedback Steve. For the H4 TNC we have been testing the critical rate is 12000 samples per second. It is important to test on this rate as it is not uncommon for certain rates to have large differences so it is important to run the test at the desired sample rate.

Ron,

Not necessarily propagation...If the station sending to you for example has a playback rate of say 12024 Hz instead of 12000 (a + 2000 ppm error) you could see poor decoding since your rate does not closely match his.

I have some ideas on some more aggressive compensation that I will look at...but having correct sample rates (say +/- 500 ppm) makes a big difference.

Hi Rick,

I ran the CheckSR program on my Kenwood TS-590 with its built in sound card. The difference PPM was 0, both input and output.

When I see this kind of decoding problems I just take it for granted that it's just poor propagation.

There are some ways to compensate for this error in the software (the "calibration" is really just a compensation in the H4TNC DSP code) and I am evaluating some different ways.
If you have a sound card or sound card interface that is over 1000 ppm please report it to the reflector along with the sound card type so we have some idea of what percentage of those with problems we have.

Just for reference: The SCS PTC II and DR7xxx DSP TNC have a very stable temperature compensated Xtal oscillator that is better than 10 ppm. This is what is required for really high performance DSP. Some tests I have done on the built in sound cards on the newer radios (Kenwood TS-590, Icom 7100, 7200, 7600) have been very good too...< 100 ppm.

Doug,

To get the numbers to be stable you have to let the CheckSR run a long time (a minute or more). Remember it is averaging results taken over many trials.

Also remember it is not just YOUR sample rates but he combination of the playback and sample rates of the two stations. If your station is < 200 ppm capture rate error but the remote station has 5000 ppm playback error you will get the cyclic decoding issues observed. I am working on some code that will minimize this. But IMHO trying to play around with any sound card mode with a sound card with > 1000 ppm error is like threading a needle wearing boxing gloves! There are good $10 solutions out there if one looks and tests with the CheckSR.exe program.

Subject: [V4Protocol] RE: Sound Card Sample rate checker

Hi Rick,

I used the CheckSR.exe against the internal USB soundcard in my Icom 7600 and the external SignaLink USB. The numbers just jumped all over, but neither was over 144. Then, without making any changes I checked both with fldigi using its WWV check. Using an adjustment of 0 for both sound inputs produced a straight line. I hope that small contribution will help.

I am, however, still puzzled by the very obvious dips in output when running FEC. This is not evident with the FSKID, just FEC text and the beacon.

From: Rick Muething
Topic: 3575 Message: 3592

Doug,

The power dip is really just the reduction in AVERAGE power due to the Two tone sync signal (sent every 1024 ms for 128 ms). The 4FSK signals (data) are single tones and so have a peak to average power ratio of 1.0 vs the 1.4 Peak to average power of the sync signal. This is normal

Subject: [V4Protocol] Blips in Power Out on FEC

I noticed that when sending text in HAM4 the output power goes to whatever level I set an then repeatedly has sharp but brief drops about every 1 1/2 seconds. The power dip is so sharp the I can even see it on the amp meter on the power supply. I do not see this with the FSKID. And I have checked the older V4CHAT and this does not happen. Is there some repeated cycling that would cause this in HAM4? Is anyone else noticing this?

For what it is worth, I have an Icom 7600 and I am using the USB interface.

Subject: Re: [V4Protocol] Sound Card Sample rate checker

Hoby,

If you read about he utility program CheckSR.exe you will find that it uses the computer time of day clock for the reference interval. (if you are going to count the number of samples per second ...actually averaged over MANY seconds... you MUST have some absolute reference for the “second” and that is when the computer clock is used. In virtually any computer the time of day computer clock is not the same reference used for the sound card. So the bottom line is you can expect normal variations from the same sound card across different computers due to their non perfect time-of-day reference clocks. The instructions suggests these variations (due to computer clock) are in the range of +/- 100 ppm or less (that would be on the order of a 10 sec/day real time clock error.

What the CheckSR does is measure the actual sample rate of the sound card (by counting the number of samples in a given period of seconds) . There are two major problems seen on sound cards...especially low cost ones:
1) All the rates are off by approximately the same ppm. This is due to error in the sound card’s reference oscillator...Some you cheap $.25 “xtals” with poor frequency tolerance and high drift. Errors of +/- 2000 ppm are not that uncommon. (as a contrary example the sample rate reference in the SCS PTC II and similar DSP TNCs is on the order of +/- 10 ppm or better)

2) Some sound card chips use logic to approximate the sound card sample rate on some settings. On these you may find the cardinal settings like 96000, 48000 etc. Very good (say < 200 ppm) but some of the other rates (especially 44.1KHz 11.025, 8 KHz) to have much larger errors say +/- 2000 ppm or more. This is not due to the xtal frequency but to approximations in the reference generator mechanism. For playing a song you would probably

never notice 2000 ppm error but when it comes to demodulating certain modulation types using DSP it is a BIG error and depending on the modulation scheme and number of carriers used and their spacing NOT easily corrected (e.g. with a reasonable amount of CPU resources) by software.

Subject: Re: [V4Protocol] Sound Card Sample rate checker

□

After using CHECKSR for several years, I have found that the samplerate of the soundcard is determined in reference to the time base of the computer. So the card is usually very good unless the time base of the computer is poor. You can take the same soundcard and use it with two different computers and get two different results.
My two radio computers (one WIN7, AMD ATHLON II X4 650 GHz w/8 Gig RAM) routinely gives much better results from CHECKSR. The other (XP CELERON 440 - 2GHz w/1 Gig RAM) is not so stable. My SL on the WIN7 shows a +31 PPM Input, and + 37 PPM Output error. My XP shows the same SL with -97 PPM Input and -101 PPM Output error.
The clock on the Win7 machine will normally run several days with the clock varying only a very few seconds. The XP will run the same time, but the clock error will be many seconds, maybe even close to a minute.
This stability is shown when running M110A (MARS, not legal on Ham bands) the XP will lose sync much sooner than the more stable WIN7 one.
So, don't be in a hurry to blame the soundcard itself.
As a contradiction, my XP machine seems to decode H4Chat much better than the WIN7.. Go figure..

Hey Rick. . .

I downloaded the utility tonight and let it run for about 10
minutes on the microHAM micro KEYER II. I was busy with
a chore and let it run.

When I returned, I found the following:

Sample Rate 12,000

Input Output

Sample rate, Hz 11999.90 11999.98

Difference ppm -8 -1

Just for grins, I went ahead and ran the test at 48000
and came up with these results:

Input Output

Sample rate, Hz 48000.63 47997.71

Difference ppm 13 -47

Hope that helps. . .

Howard,

Those are very good numbers and would not require any compensation in virtually any application. The problems observed were mainly from those using sound cards with sample rate errors of 10000 ppm ...about 1% . With that much error correction is difficult or impossible.

I am working on a scheme (now testing) that would accommodate up to about +/- 4000 ppm which is way over what any decent sound card should have.

Thanks for the feedback....I suspected the microHam to be good.

Doug,

Both those are good numbers and easily correctable with DSP compensation. The main problem appears to be from those using sound cards with sample rate errors in the 10,000 ppm range...1%. This is beyond what is really practical to do in most DSP correction schemes. I am working on a new mechanism that will compensate up to about +/- 4000 ppm which should cover most every case.

Thanks for the feedback

Difference PPM 6827

Sample Rate HZ: 44100

Input: 44098.33

Difference PPM -37

Output 44098.51

Difference PPM -33

This is from the Stores Signalink and FT 920.

From: <w4wnt@...>
Topic: 3566 Message: 3601

I have an old Dell Dimension 4500 desktop that I use for digital radio using a Signalink USB interface. I tested the sample rates at 12000 and initially the in and out numbers were all over the place settling around 150-200 In and -250 to -300ppm Out. These numbers were without any digital program running, just the Signalink on.

I switched screens to Firefox to look something up and when I went back to the checker, the numbers were in the thousands. After a while they settled down to lower numbers.

I was also running a VOIP phone program, when I shut it off and let the checker run for a few minutes, the numbers went to In -20 to +60, Out -40 to +80.

I let the checker run for an hour and they settled to In -10 and Out -24.

Looks like for older computers, multiple running programs will affect the results.

Doug,

Both those are good numbers and easily correctable with DSP compensation. The main problem appears to be from those using sound cards with sample rate errors in the 10,000 ppm range...1%. This is beyond what is really practical to do in most DSP correction schemes. I am working on a new mechanism that will compensate up to about +/- 4000 ppm which should cover most every case.

Thanks for the feedback

Subject: RE: Re: [V4Protocol] RE: Sound Card Sample rate checker

Hi Rick,

I re-ran the CheckSR app against both the IC-7600 and SignaLink at 12000 HZ setting, allowing each to run for 2 minutes. The 7600 produces +30 In, +30 Out. The SignaLink produces +241 In and +120 Out. I hope that adds some useful info to solution.

Doug, N3JXB

---In V4Protocol@yahoogroups.com, <v4protocol@yahoogroups.com> wrote:

Doug,

To get the numbers to be stable you have to let the CheckSR run a long time (a minute or more). Remember it is averaging results taken over many trials.

Also remember it is not just YOUR sample rates but he combination of the playback and sample rates of the two stations. If your station is < 200 ppm capture rate error but the remote station has 5000 ppm playback error you will get the cyclic decoding issues observed. I am working on some code that will minimize this. But IMHO trying to play around with any sound card mode with a sound card with > 1000 ppm error is like threading a needle wearing boxing gloves! There are good $10 solutions out there if one looks and tests with the CheckSR.exe program.

Subject: [V4Protocol] RE: Sound Card Sample rate checker

Hi Rick,

I used the CheckSR.exe against the internal USB soundcard in my Icom 7600 and the external SignaLink USB. The numbers just jumped all over, but neither was over 144. Then, without making any changes I checked both with fldigi using its WWV check. Using an adjustment of 0 for both sound inputs produced a straight line. I hope that small contribution will help.

I am, however, still puzzled by the very obvious dips in output when running FEC. This is not evident with the FSKID, just FEC text and the beacon.

Doug, N3JXB

---In V4Protocol@yahoogroups.com, <v4protocol@yahoogroups.com> wrote:

All,

Here in LA. No radio equipment so can’t participate in any over the air testing.

I have investigated some of the decoding problems observed showing a cycling of the decode quality which look something like this:

I am now pretty convinced this is due to some significant errors in the sound card capture or Playback rate. The current beta software should have enough correction capability to handle up to +/- 1000 ppm (.1%) error but the above type of distortion seen in some cases is something more like 10,000 ppm or 1% .Pretty bad for even a cheap sound card
I have uploaded a utility program found in the MixW software package called CheckSR.exe to the V4Protocol FTP section. If you download this simple utility you can check the accuracy of your sound card.
I would suggest if you are seeing results like the above or others have reported seeing your signal like this then run the simple CheckSR.exe program.
To run select 12000 Hz sample rate (that is what is used on the H4Chat program. Start it and let it run at least a minute or more. Stop and look at the errors reported in ppm. If they are over 1000 the sound card is suspect. If you see over 1000 on the capture rate try another test at 48000 and see how it compares to the first test. (normally 48000 and 12000

are more “cardinal” rates which have been shown in many tests to have the lowest errors on most sound cards).
There are some ways to compensate for this error in the software (the “calibration” is really just a compensation in the H4TNC DSP code) and I am evaluating some different ways. If you have a sound card or sound card interface that is over 1000 ppm please report it to the reflector along with the sound card type so we have some idea of what percentage of those with problems we have.
Just for reference: The SCS PTC II and DR7xxx DSP TNC have a very stable temperature compensated Xtal oscillator that is better than 10 ppm. This is what is required for really high performance DSP. Some tests I have done on the built in sound cards on the newer radios (Kenwood TS-590, Icom 7100, 7200, 7600) have been very good too...< 100 ppm.

From: Rick Muething
Topic: 3566 Message: 3603

Bill,

It is important to remember that the CheckSR is a measurement program and by nature is not super precise. ...Consider this: 100 ppm is an error of .01% pretty small. To make that precise of measurement using the computers Time of Day clock requires two things:
1) That the time of day clock itself is precise ...most computer clocks aren't better than about 100 ppm or so (about 10 seconds per day). So your actual measured value using the TOD clock can never be better than the reference.
2) That the interval needs be fairly long (or the number of repeated measurements to average large) to get any kind of accuracy. That is why the CheckSR values jump around a lot until it gets many numbers of samples to average. It takes at least about 60 seconds of operation to get fairly stable values. If you let it run long the number will converge on the actual measurement value BUT it can never be more accurate than the reference time base which is the computers time of day clock.

Running multiple programs at the same time has some affect on the ability to accurately capture timing details due to OS latency issues. The multiple programs aren't really changing the sample rate...they are just slightly changing the measurement (by the CheckSR and computer time of day clock).

In any event if your sound card measures less than 1000 ppm error it will certainly work with the DSP and Compensation code in the H4 TNC. I am working (still needs some testing) on a sound card compensation technique (does not require any "calibration" to accommodate +/- 4000 ppm error...If it is worse than that you need a new sound card!

3604. Re: [V4Protocol] va7dgp SL sampling

Yahoo group: V4Protocol
Date: 2013-10-29 21:38:37 UTC
From: Rick Muething
Topic: 3598 Message: 3604

Don,

These show what are unfortunately common errors with certain sound card chips. Note the big error (6827 ppm) in output at 11025 Sample Rate ....this is not that uncommon and a function of the chip set used to make the sound card. It is the reason that all the programs I write do not use these “non cardinal” values (8000, 11025, 44100) . Usually 96000, 48000, 12000 are more accurate on virtually all chip sets used.

I think if you repeat the measurement with a sample rate of 12000 you will find that the SignaLink USB is fairly close on both Input and Output (Probably < 300 ppm). It any case that is plenty good for the H4 DSP code.

From: W6IDS
Topic: 3599 Message: 3605

I went up there around 2345Z just to test out the program for myself.

I found 28120.000 alive and busting out with PSK31 – it seems the band was open. As I was tuning from 28050 up and through 28230, I lost count of all the AM activity that was alive and kicking as well. It was a virtual DX band opening for the CB crowd. Strong signals (amps not withstanding obviously) and plenty, plenty stations abound.

In so far as our Chat activity is concerned, for planning purposes, I'd say that we've truly lost control of the 10m band and it's not clear to me what our own activity may be like insofar as coexistence with CBers is concerned. They're operating in our midst with no fear.

BTW, there's a W7PFI 10 meter beacon really close to 28230.000 which could be an issue. The station has a legitimate purpose there.

From: David Michael Gaytko // WD4KPD
Topic: 3616 Message: 3616

trying everything i can to get chat to communicate via cat with my ft-920.

all other multimode programs do communicate, sometimes using dxlab/commander, fine with the rig.

one parameter i know will mess the comms is the number of stop bits. i can not find in the chat.ini where the stop bit is mentioned.

anyone using the chat/ft920 combo, please let me know about you experience.

i believe that awhile back this stop bit did happen in one of my programs, but don't remember which one. just had to go into the .ini file and change it. then all ok.

david/wd4kpd

I'm at home. I don't remember the set up but I have 8n2 4800. Not sure if I have RTS/CTS checked but I have a feeling it has to checked. I use USB not USB Digital for the FT 920 at the shop. I can get info in the AM,

3618. AW: [V4Protocol] Chat 0.1.6.0 Uploaded to Yahoo FTP, Winlink FTP and Autoupdate server

Yahoo group: V4Protocol
Date: 2013-11-01 03:32:46 UTC
From: siegfried jackstien
Topic: 3470 Message: 3618

Hello rick ... that would be nice if you find a solution (pause polling while transmit) ... it is just a slight background noise (a few milliwatts I guess) ... a few watts if I accidently forget to switch off compressor in the rig ... but with pause the polling there should be silence ... right?!?

Dg9bfc

Sigi

Ps maybe I should try usb isolator for cat?!?

Sigi,

Polling the radio for frequency will be off during transmit on the next rev. You should not use compression on virtually any digital mode...it distorts the waveform (not too bad for voice but no good for digital).

Hello rick ... that would be nice if you find a solution (pause polling while transmit) ... it is just a slight background noise (a few milliwatts I guess) ... a few watts if I accidently forget to switch off compressor in the rig ... but with pause the polling there should be silence ... right?!?

Dg9bfc

Sigi

Ps maybe I should try usb isolator for cat?!?

how are you getting your ft920 to talk to chat....absolute failure here.
David/wd4kpd

---In V4Protocol@yahoogroups.com, <v4protocol@yahoogroups.com> wrote:

Thanks Fred,

Good that means your set function for the 920 is working and I'll put in the code for the read back (so the waterfall updates when you rotate the transceiver dial) for the 920. That code will probably work for some of the other models as well (but not all!)

Rick

☐ Hi Rick,

I use the FT-920 and I CAN click on the waterfall and change the receiver frequency. I'm not at the rig right now
but I believe that if I click on one of the green waterfall lines it changes the receiver frequency and the frequency under
the waterfall by 200 hz. Appears to work fine. I can't change the frequency under the waterfall by tuning the receiver.
Clicking on the mini log works also and has worked since the first version of V4 I had.

Hope this helps,
Fred, W1WYC

All I am working on the last major fixes/enhancements for the next rev. I need a couple of evaluators (not many) for two important areas that I can't very well test here myself:
1) I need some that have had problems with Autoupdate. Two problems have been reported and I have made changes and added logging to fix and track these down. a) License problem with IPWorks and b) Problems believed to be related to firewall or router blocking. If you fall into one of these categories and can spare a few minutes please let me know.

2) Those with some of the more popular Yaesu models. I am still working on the Yaesu control and read back and I will probably have to make several iterations. Let me know which model(s) you have and I will get the manual (we subscribe to a download source) and try and put in the appropriate driver. If you can already set the frequency in V4 (via the

mini log or waterfall click) that is a good start since half the code is there and working already.

I will send you the new evaluation code (full install) and/or post it on the Yahoo FTP. At this stage I do not want to post any untested code into the auto update server. All the changes in process are compatible with the current 0.6.1.0 rev.

73,
Rick KN6KB

Do you run other programs like PC-ALE, FLDIGI. Programs may look like they are shut down but still control. I also remove the USB serial converter as the program may loose the comport. I also scan Harddrive for chance. That's after I pull USB out. Make sure it put back into same plug. It could also be that your USB plug is dead and you may need to find another port that works.

I would also remove the program and put it in another folder other than program files. C:\chat. See if your USB/serial is picked up by the PC and program. If it works with rms it should work H4chat. If H4chat won't control see if HRD will run VFO if it does then use it to control the VFO.

At this point I'm grabbing at straws. I know I've had issue with my serial PIEXX VFO controller. It's when I'm chatting on simplex on the Dual Band. My PIEXX controller heads to the toilet and I have to play with the software settings to get it to work. I do have more snap on ferrite on every cable but I still get issues.

Later

Don

I'm at the shop tomorrow 10:00 am to 15:00 pm. (Pacific) I will again take a closer tomorrow. Burnaby Radio Communication.

From: Don Poaps
Topic: 3622 Message: 3622

Greeting

My typing skills are hunt and peck. I've had a contact the other day. I have a text file with some general info.

I did copy the Callsign but it didn't get into log. I'm not an IT guy but how easy would it be to have a generic macro edit. Ie <CALL> de <MYCALL>. One could right click copy call and it drops into contact. Then when modifying text file one can could add the macro syntax as one does not know who's going to connect to. Am I off base here?

Hello rick

I will try it out (when available)

Yes I know compression is not good

I do not use it for digital ... but sometimes for voice

Letting it on accidently is bad for sure

3624. H4 Beacon inital Radio tests of version 0.1.6.1

Yahoo group: V4Protocol
Date: 2013-11-03 19:08:17 UTC
From: Rick Muething
Topic: 3624 Message: 3624

All,

I am doing some initial beacon testing of the H4 TNC and updated Chat program (ver 0.1.6.1) . I am running a 50 watt beacon on 28230.0 USB dial every 5 minutes. This is testing some new features and code. Please report if you copy and try answering if possible. I have maximum logging enabled to capture the performance of the new mods at my end.

I hope to have a new rev out in the next few days. This is still FEC mode only but cleans up some important issues and should allow better copy especially from sound cards with substantial sample rate inaccuracy.

Once I get this cleaned up for release (Chat also has some changes making it more efficient for typing) I will get into the ARQ stuff.but first it is necessary to get a good solid base with the FEC mode. (sort of like building a house.you have to have a solid foundation!)

I'm not sure how good my antenna is here on 10 meters (it is actually a trap dipole for 30, 17, and 12 meters) but at least the tuner tuned it OK. If there are other frequencies that you are all using let me know and I'll move to them.

73,

Rick Muething, KN6KB

I can hear some CW down in the noise but it doesn't sound like your call sign Rick. This is around 2200Z and for what it's worth, I did copy PY3ZZ clearly. I called him three or four times to no avail. He was calling CQ a couple of times while I listened, etc.

Plenty of PSK on 28120 BTW. Never did connect with the PY3. Well, not with you either <GRIN>.

I copied Rick's beacon two times in the last hour. Nothing more.
Heard some short transmissions, but no decode.

Welcome back to FL, Rick! :-) Regarding the choice of a frequency that we can reliably test on that would likely be within the coverage of most North American based stations most of the time (plus overseas as well in the evenings) I suggest that 10.123.00 Mhz would be the best choice,

Thanks Russ,

Had trouble (flight cancelled) getting out of LAX due to the terminal shooting. But good to be home! New (4 week old) grand daughter a kick!

I now have the beacon on 10123.00 USB dial for some testing. Just about ready to release the auto update..

Rick

3630. Final KN6KB pre release testing of Chat and H4TNC testing on 10123.00 USB dial

Yahoo group: V4Protocol
Date: 2013-11-04 17:09:15 UTC
From: Rick Muething
Topic: 3624 Message: 3630

All,

Running some final checks on the new Chat and H4TNC release (will be version 0.1.7.0) here. Beacon is 50 watts on 10123.00 USB dial.

Appreciate any replies on frequency to verify improved auto tuning functions.

I hope to have an auto update release out later today or tomorrow. Still just FEC mode but should be able to focus on ARQ soon.

73,

Rick Muething, KN6KB

Food for thought regarding FT920 VFO

FT920 works with RMSexpress but it is not being picked up by last version.
I have no problem with Kenwood VFO set up.
At the store FT920 no go, at home Kenwood TS850s works great.

I hope to have an auto update release out later today or tomorrow. Still just FEC mode but should be able to focus on ARQ soon.

Don,

I’m comparing Chat radio control code with RMS Express ...don’t see any differences for Yaesu. What radio setting are you using? What is not working? (I think Frequency read back is unique to Chat so that may be the issue).

Thanks

Rick KN6KB

Subject: Re: [V4Protocol] Final KN6KB pre release testing of Chat and H4TNC testing on 10123.00 USB dial

Food for thought regarding FT920 VFO

FT920 works with RMSexpress but it is not being picked up by last version. I have no problem with Kenwood VFO set up.
At the store FT920 no go, at home Kenwood TS850s works great.

Welcome back to FL, Rick! :-) Regarding the choice of a frequency that we can reliably test on that would likely be within the coverage of most North American based stations most of the time (plus overseas as well in the evenings) I suggest that 10.123.00 Mhz would be the best choice,

All,

I am doing some initial beacon testing of the H4 TNC and updated Chat program (ver 0.1.6.1) . I am running a 50 watt beacon on 28230.0 USB dial every 5 minutes. This is testing some new features and code. Please report if you copy and try answering if possible. I have maximum logging enabled to capture the performance of the new mods at my end.

I hope to have a new rev out in the next few days. This is still FEC mode only but cleans up some important issues and should allow better copy especially from sound cards with substantial sample rate inaccuracy.

Once I get this cleaned up for release (Chat also has some changes making it more efficient for typing) I will get into the ARQ stuff…but first it is necessary to get a good solid base with the FEC mode. (sort of like building a house…you have to have a solid

foundation!)

I’m not sure how good my antenna is here on 10 meters (it is actually a trap dipole for 30, 17, and 12 meters) but at least the tuner tuned it OK. If there are other frequencies that you are all using let me know and I’ll move to them.

3636. Chat 0.1.7.0 Beta uploaded to Auto Update Server, Yahoo FTP and Winlink FTP sites

Yahoo group: V4Protocol
Date: 2013-11-04 22:01:09 UTC
From: Rick Muething
Topic: 3636 Message: 3636

All,

I have uploaded the latest beta version to the above servers. This is still a FEC only version though it has many small and important enhancements noted below.

If there are serious problems please let me know. The help has all been updated and should be current with the new version. With the exception of some issues or expansion of the radio control for some radios this should be very functional. It includes some new utilities and tuning code to handle much wider range of sound card errors (up to about 4000 ppm).

I am working on the ARQ version. This will take some time but is progressing. I want to get the base of the FEC version working very solid and functional before introducing any ARQ versions.

Significant Changes:

Save/Recall of AutoID to Chat.ini file

Improve Session text box readability

Add Rx and Tx throughput calculation

Add frequency readback for Yaesu FT-920
(need confirmation on this)

Modify sync detect thresholding

Improve sync and symbol tracking

Add Busy channel detection and out bound
Queue control

Update Chat and H4TNC Help

I will keep my beacons operational on 10123.00 or 28230.00 USB dial

Thanks for your support and feedback.

73,

Rick KN6KB

Chat Revision History

Date: Rev Change Summary

Nov 4, 2013 0.1.7.0 Beta release of 0.1.6.1

Nov 3, 2013 0.1.6.1 Change Beacon Setup: Max length to 80 (was
70). Range 5-60 sec (was 10-120). Step 5 sec (was 10)

Modify Radio.ProcessKenwood
[remove commands to clear Beat canceller, Noise Blanker, Noise Reducer,

Do not disable tuner if
Enable Internal Tuner unchecked.(leave as set in radio)]

Modify Main.tmr Poll to use
blnPTT variable to block Radio frequency read request if PTT active.

Change Session text box sent
text from green normal to green italic text. (matches font style in Keyboard
text box)

Add save/recall of AutoID
status to Chat.ini file

Change ScrollLock auto reset
to 10 seconds (was 30)

Add extra vbLF to bottom of
display to improve last line readability.

Update RX throughput
calculation to 30 sec rolling avg and 450 bytes/min (75 words/min) max.

Change spelling of "7Bit" to
a consistent "7BIT" in ASCII encoding definitions.

Add Frequency Read back for
Yaesu FT-920 in Radio.GetFrequency (' Op code needs verification)

Oct 22, 2013 0.1.6.0 Release of 0.1.5.1

H4FSK TNC Revision History

Date: Rev Change Summary

Nov 4, 2013 0.1.7.0 Beta release if 0.1.6.1

Nov 4,2013 0.1.6.1 Trial version to evaluate mods to reduce false
tune detection.

Ratio
multiplier calculation changed from Thresh/10 to Thresh/5 (increases the
importance of two equal tones in Sync)

Threshold of
dblPriorCor in ProcessNewSamples changed to (1 - Squelch/10) was .5
(requires stronger value for low thresholds)

Add logic in
H4FSKInterface.Poll to abort if playing (FEC mode)

Add debug
logging for unbounded SampleResyncOffset in H4Demod.AdjSymbolSync62BMix to
log sync drift per frame. (re assess bound limits)

Expand
bounded sync adjustment in AdjSymbolSync62Bmix from +/- 14 to +/- 40

Change
required sample length in ProcessNewSampes.Capture Stat Track from 1536 +
192 to 1536 + 288 to insure at least one pass.

Add
H4Demod.SRCompensation to use phase difference in pairs of the same tone to
determine correction for pointer.

(handles
larger SR errors up to 4000 ppm) [needs on air verification]

Add Average
Sample rate calculation and display on Help drop down list.

Add utility
in Test drop down list to make an approximate measurement of playback rate.

Change
amplitude of 4FSK data and leader (mult x .707) to make same RMS value of
sync.(constant output power)

Change
polling timer in Interface from 20 ms to 64 ms (reduces CPU loading)

Change
Tuning range control in Basic setup to cover range 10 to 100 (was 50 to 150)

Modify
H4FECMod.SendFECBytes to echo back sent data before appending EOT.

Modify
H4FECDemod.ProcessNewSamples to not send characters with value < 31 to host
in FEC mode (blocks non printing chars)

Added RED
busy indicator to right end of main menu line on Interface form. (Triggers
with sync detect and sets blnChannelBusy.

Clears busy
in 1.1 sec of no sync detect)

Block
sending of OB Queue if blnChannelBusy

Mod
H4FECDemod.ProcessNewSamples to make small adjustment in detection threshold
for Tune and Track states

Update Help

Rick, knowing your busy, etc etc. . . . let me make a comment.

I am unable to wrap my mind around the concept of having my transmitted text appear “twice” locally. I know there’s probably a reason for it as requested by “someone.” However, that someone would be in a fix if running a normal TNC with Pactor or something else I suppose if they need this type of visual aid.

I’m finding it distracting, especially when trying to root out who’s sending back to me with their own comments. Visually, it’s sort of cluttered to ME and of course IMHO. I don’t know if anyone else is bothered by it but I am for the sake of discussion and I thought I’d pass my comments along.

Mark, Howard,

Re Session text Box:

The concept I used in the session text box (which is always logged to the Chat <date>.log) has the full text of the QSO along with status info contained in one text window. This includes the text sent (now in Green Italic type) and the text received (in normal black type for FEC). In the log (which is not rich text to reduce log bulk) the sent and received text are indicated by keys e.g. {Rcvd FEC text} etc. This permits going back in the log and being able to read in time sequence the text (from both ends) as it was sent and received.

Unless you are using full duplex (not likely at least on HF) or just testing with full duplex audio) the sent and received text will not be the same in the Session window (e.g. Your receiver is usually blanked when the transceiver is keyed unless you have a RF monitor enabled.) If you are using an audio loop back (sound card audio out connected directly (or acoustically) to sound card audio in) you of course will see the Sent (green italic text) immediately followed by the received text (black normal text). But this is not the normal way the program is used with a radio.

The reason transmitted text is entered into a separate window is to allow editing (backspace, delete etc.) BEFORE text is committed to the outbound Queue which then becomes un editable. The cursor control is set up so that you can't go back and edit text already sent to the outbound Queue (though you can Capture it to the clipboard).

I am open for other ways to do this but this has been worked out (similar version in the old V4Chat) and generally has been well received by users. The one customizing feature that is asked for is various ways to "commit" the text to the output queue so there are now 4 options to select this …its really a matter of personal preference. I personally use the CR or double space as the "commit text" option.

Re HRD:

The problems with this and other similar third-party interface programs are this:

1. Often they introduce delay (due to polling cycles etc.) that can delay the commands 100-200 ms or more. That may not seem like a lot but in an ARQ mode adding 100 + ms and the additional uncertainty due to polling (timing ambiguity) requires substantially increasing the timing guard bands on ARQ cycles and that has a significant impact on ARQ throughput and makes it difficult to build in accurate round trip measurement and compensation. As an aside Pactor ARQ requires a hardware PTT control with < 50 ms delay ….there is a reason for that and why it is very difficult to implement Pactor in PC software and why Pactor can't use software control of PTT.

2. There are functions like Click to tune, Aux Mux control, and frequency read back that are not always supported by some interfaces.

3. It adds an uncontrolled third-party piece of software in the tight Chat<> Radio interface. I have no control over how or when they implement functions or new radios. I cannot force them to implement a change to accommodate some needed feature or timing. E.g. Radios with built in sound cards (Icom 7100, 7200, 7600, Kenwood TS590S) require specific AUX mux commands that may not be implemented in some of these interfaces.

Hope this addresses some of your questions/issues.

Hi Rick,

I learn something everyday in this hobby :-)

I have a Kenwood TS-590 using the built in USB sound card. When I turn on the monitor feature of the radio, so I can hear what is being transmitted, in the text window I will get black normal text and the green Italic text, which I thought was the way the program was designed and a little confusing because of all of the activity in the text window. I guess this is called full duplex audio. If I turn off the monitor feature then I don't get the black type just the green type. I'll have to see which one I like because it's nice to hear your transmission but turning it off will make the receive window easier to read.

Ron,

Well yes I guess we do learn something every day…I have a TS-590S too and never fiddled with or knew there was a receive monitor!

I don't think the TS590S (or most HF radios) can really operate full duplex well…that is Listen to one DISTANT station on one frequency while SIMULTANEOUSLY transmitting on a DIFFERENT frequency on the same or another band. Most HF radio receivers will overload and anyway you would need two separate antennas. The H4TNC will support that full duplex operation (On FEC mode the Playback (Send) and Capture (Receive) functions are independent and can operate simultaneously) but normally it would not be used for monitoring your OWN transmission (except for testing).

If it really is a problem (with the confusing double text) I can easily put an option to suppress the full duplex function (Disable receive if PTT is active) but that should be selectable since "back-to-back audio" connections are useful for local testing and for training (e.g. Two laptops…Speaker output of each going to the mic input of the other) . I have used such kind of setups in training for WINMOR before.

ARQ is a different animal. It is much more complex to try and provide full duplex ARQ and since it is not very practical "over the air" it seems like a lot of effort and complexity for no real gain or purpose. Creating a full duplex ARQ protocol on HF is tricky (both sides would have to be both ISS (sending station) and IRS (receiving station) SIMULTANEOUSLY!)

Thanks for the feedback.

was designed and a little confusing because of all of the activity in the text window. I guess this is called full duplex audio. If I turn off the monitor feature then I don't get the black type just the green type. I'll have to see which one I like because it's nice to hear your transmission but turning it off will make the receive window easier to read.

On 11/5/2013 5:28 AM, Rick Muething wrote:

Mark, Howard,

Re Session text Box:

The concept I used in the session text box (which is always logged to the Chat <date>.log) has the full text of the QSO along with status info contained in one text window. This includes the text sent (now in Green Italic type) and the text received (in normal black type for FEC). In the log (which is not rich text to reduce log bulk) the sent and received text are indicated by keys e.g. {Rcvd FEC text} etc. This permits going back in the log and being able to read in time sequence the text (from both ends) as it was sent and received.

Unless you are using full duplex (not likely at least on HF) or just testing with full duplex audio) the sent and received text will not be the same in the Session window (e.g. Your receiver is usually blanked when the transceiver is keyed unless you have a RF monitor enabled.) If you are using an audio loop back (sound card audio out connected directly (or acoustically) to sound card audio in) you of course will see the Sent (green italic text) immediately followed by the received text (black normal text). But this is not the normal way the program is used with a radio.

The reason transmitted text is entered into a separate window is to allow editing (backspace, delete etc.) BEFORE text is committed to the outbound Queue which then becomes un editable. The cursor control is set up so that you can’t go back and edit text already sent to the outbound Queue (though you can Capture it to the clipboard).

I am open for other ways to do this but this has been worked out (similar version in the old V4Chat) and generally has been well received by users. The one customizing feature that is asked for is various ways to “commit” the text to the output queue so there are now 4 options to select this …its really a matter of personal preference. I personally use the CR or double space as the “commit text” option.

Rick,

It's easier to turn off the monitor feature in the 590. It actually
makes for a quieter operation. I thought the monitor was just a local
receive function but it looks like there is feedback to the USB
connection as well. Thanks for the information, very interesting.

Ron,

Yes I really like these radios with the built in sound cards. We have done some testing with them and the sample rate accuracy and stability of the sound cards are excellent. Also of course they are much more “RF resistant” for the audio and you can’t beat the one cable plug and play. It probably only adds a few bucks to the cost of the radio so I suspect we’ll see most of the newer HF radios including the USB interface and built in sound card. The only downside is they require some radio model specific control codes to toggle the Aux port between Internal Sound card and External AUX input. (of course this can be done by menu on the radio too if needed)

Hi Don,

KN6KB beacon very strong here in Pa. I saw WA4BDS in a QSO with W4WNT
but I didn't copy W4WNT. Also I sent a couple of beacons out. I never
get a chance to copy you Don so I guess the RF path isn't there between us.

Don,

Well the Yaesu documentation is so poor it make Icom's look good (and they aren't!) I have the manual for the 920 and I thought I have the right op code and format. Is the setting frequency, setting mode and readback not working? If readback is working the frequency should show on the bottom of the waterfall of the H4TNC and follow as you move the receiver dial.

Thanks,

Rick

hello rick....

same problems here with ft920. there be no response from the rig to the inquires. the "cat" let on the rig is not blinking as it should when a connection has been made to a program. i would ask you to check in the guts to see if the number of stop bits is set to "2".

fldigi/dxlab commander and many other programs do work fine.

The radio belongs to the store owner. I do this between answering phone, shipping ham products etc. as well as showing how RMS and other software works with Soundcard.

At this point the answer is no. It's the same set up as RMS express.

3660. AW: [V4Protocol] KN6KB Beaconing H4 on 28.230.00 USB dial

Yahoo group: V4Protocol
Date: 2013-11-06 18:31:30 UTC
From: siegfried jackstien
Topic: 3655 Message: 3660

I use "hardcopy" ... a software that does all what is needed for "screen-grabbing"

You can either select a window ... or whole screen ... or draw a rectangle with the mouse

and has dozens of other functions also (like you have in paint or similar software)

dg9bfc

3661. RE: [V4Protocol] KN6KB Beaconing H4 on 28.230.00 USB dial

Yahoo group: V4Protocol
Date: 2013-11-06 19:25:18 UTC
From: Rick Muething
Topic: 3655 Message: 3661
Attachments: 2 described; binary payloads are missing from this source WARC

Sigi, all,

Windows 7 (and 8 too I think) already has a built in free ☐snipping tool☐ that will capture images etc. It is what I use to capture all the screen images, pictures etc. for the Chat and H4TNC Help. [Start, All programs, Accessories, Snipping tool]

Rick KN6KB

From: V4Protocol@yahoogroups.com [mailto:V4Protocol@yahoogroups.com] On Behalf Of siegfried jackstien
Sent: Wednesday, November 06, 2013 1:32 PM
To: V4Protocol@yahoogroups.com
Subject: AW: [V4Protocol] KN6KB Beaconing H4 on 28.230.00 USB dial

I use "hardcopy" ... a software that does all what is needed for "screen-grabbing"

You can either select a window ... or whole screen ... or draw a rectangle with the mouse

and has dozens of other functions also (like you have in paint or similar software)

dg9bfc

sigi

3663. Question

Yahoo group: V4Protocol
Date: 2013-11-10 20:49:39 UTC
From: David Boland
Topic: 2196 Message: 3663

Is there a way to send formated traffic on Chat so it
will send as a formated file and not run together
looking as a possible method to send in state
traffic on a MARS net

Program works great
Dave W9NWY/ NNN0ZTT

Hi,

Just installed V4 and now looking for contacts on 30m.

Cheers,

Dave

3666. Test update of Chat version 0.1.7.2 and H4TNC ver 0.1.7.3 on Test Autoupdate server.

Yahoo group: V4Protocol
Date: 2013-11-18 22:23:59 UTC
From: Rick Muething
Topic: 3666 Message: 3666

All,

Thanks to some very worthwhile feedback from Dave W9NWY I located and fixed some important issues that were causing formatting problems (problems in the Session window display) especially when sending formatted text files. I also included the acceptance of Tab characters in the session window.

I am still doing some testing and refinements but you can evaluate this test version by doing the following:

Shut down Chat and The H4TNC.

Go into the Chat directory and bring up Chat.ini with notepad or a basic text editor.

Add the following line (as a separate line) to the [Main] section:

Test Autoupdate=True

Save the Chat.ini file and restart Chat. After a few minutes it should prompt and download the updates if you are running Chat 0.1.7.0 or later.

I hope to come out with a new full release in the next few days.

Still working on ARQ .just too many irons in the fire!

73,

Rick Muething, KN6KB

Chat Revision History

Date: Rev Change Summary

Nov 18, 2013 0.1.7.2 Remove Trim of strFileData in mnuPasteAndSend.click to accomodate leading/trailing CR/LF in user text files.

Add code to correctly
save/recall Horizontal and Vertical Splitters to INI file.

Nov 7, 2013 0.1.7.1 Add intTrace statements to H4FSKInterface.ProcessCapturedData to locate rare overflow.

Nov 4, 2013 0.1.7.0 Beta release of 0.1.6.1

H4FSK TNC Revision History

Date: Rev Change Summary

Nov 18. 2013 0.1.7.3 Add back Backspace(8),
HorzTab(9), Cr(13),and LF(10) into passed characters in

Hi Rick,

I have updated the software to version Chat 0.1.7.2 - but I have not done a thorough test yet - getting near my bedtime!

I followed your instructions and inserted the line in the Chat.ini file. Also noted that there was already a line in the Main menu which said "Test Autoupdate=False - and saved the file.

On opening Chat again I got a " .NET error". I closed Chat and opened the Chat.ini file again and deleted my previous "=True" line and changed the original line from "=False" to =True and saved the file.

I opened up Chat again and waited - the auto update cut in and Chat opened up as normal. I just checked that the CAT system was running OK - that is the only test I did, will test again in the morning.

Hope this makes sense, Rick.

3672. Chat and H4FSK TNC ver 0.2.1.0 posted to auto update server, Yahoo FTP and Winlink FTP

Yahoo group: V4Protocol
Date: 2013-11-20 14:30:07 UTC
From: Rick Muething
Topic: 3672 Message: 3672

All,

This is an interim version and the first that now includes some code and documentation for the ARQ mode.

IMPORTANT!!!

THE ARQ MODE IS NOT YET WORKING..IT WILL BE SEVERAL WEEKS UNTIL IT DOES BUT I WILL RELEASE INCREMENTAL RELEASES FROM TIME TO TIME. SOME ARQ FUNCTIONS MAY BE WORKING AND SOME ARE JUST PART OF MY INTEGRATION PATH.IT IS VERY DIFFICLUT TO KEEP TWO SEPARATE VERSIONS .ONE RELEASED. ONE IN PROCESS.

I did implement a couple important fixes that are in this and affect the FEC mode as well. One was causing random data printing at the end of some frames. I also now have added in the chat setup the mechanism for including a variable "front porch" (does anyone remember the "front porch" of old analog television days???). This and the "rear porch" work in FEC mode (defaulted to the previous values) but will be most helpful in setting up and optimizing ARQ for different radios (include Flex and other SDR radios) and sound card or VAC interfaces.

Also included in the release are the preliminary state diagrams for ARQ mode..THESE ARE NOT IMPLEMENTED IN CODE YET but are in process and may provide some education on how ARQ will work...(as you can see in the updated Chat help file.its' not trivial or very pretty!!!...such is life!) I have the ARQ spec completed and it should be straightforward (but not necessarily easy) getting it to work. I am generally pleased with how the ARQ is fleshing out. My ARQ implementation plan should have minimal impact on (read hopefully won't break!) the existing FEC mode.

The full install of version 0.2.1.0 is also on the Yahoo V4Protocol FTP site and the Winlink.org ftp site ftp://autoupdate.winlink.org/User%20Programs/

This should auto update on its own (provided you have auto update enabled and the port is not blocked). It requires no manual updates/patches to the Chat.ini file as in a test auto update.

Give it a try. but please no detailed questions and feedback yet on ARQ mode.still too early. I will try and get the Chat radio set up again today (had to break down the setup for demonstrations last weekend).

73,

Rick Muething, KN6KB

Chat Revision (Recent) History

Date: Rev Change Summary

Nov 20, 2013 0.2.1.0 Release of 0.1.7.2 with initial ARQ functions
(not yet fully implemented)

Nov 19, 2013 0.1.7.2 Remove Trim of strFileData in
mnuPasteAndSend.click to accomodate leading/trailing CR/LF in user text
files.

Add code to correctly
save/recall Horizontal and Vertical Splitters to INI file.

Add options on ChatSetupForm
and Main.StartH4TNCto set Front and Back porch timing

Update Help

Nov 7, 2013 0.1.7.1 Add intTrace statements to
H4FSKInterface.ProcessCapturedData to locate rare overflow.

Nov 4, 2013 0.1.7.0 Beta release of 0.1.6.1

H4FSK TNC Revision (Recent) History

Date: Rev Change Summary

Nov 20, 2013 0.2.1.0 Release of 0.2.0.1

Nov 19, 2013 0.2.0.1 Inital coding for ARQ mode. Add
H4ARQMod.vb class. Modify ARQ functions in H4FSKInterface.

Correct
formula to compute intSyncChar in H4FECMod.SendFECbytes (could send extra
sync in some cases).

Added
FRONTPORCH (default = 125 ms) and BACKPORCH (default=0 ms) commands and
implementation to allow setting for different radios/keying.

Nov 19, 2013 0.1.7.4 Modify the
H4FECDemod.ProcessNewSamples to pass all characters except EOT(4) to the
application.

Nov 18. 2013 0.1.7.3 Add back Backspace(8),
HorzTab(9), Cr(13),and LF(10) into passed characters in
H4FECDemod.ProcessNewSamples

Nov 9, 2013 0.1.7.2 Modify
H4FECDemod.ProcessNewSamples to add AndAlso intCharCount > 0 to avoid rare
overflow by divide by 0.

Nov 6, 2013 0.1.7.1 Modify H4FSKInterface.Load to
handle safe position restore to any screen/location (for multiple screen
installations)

Add
Try/Catch to H4FECDemod.MixDecode8BitCharacter to track down rare overflow

Add
Try/Catch to H4FECDemod.TrackTwoTone62BmMix to track down rare overflow

Add
Try/Catch to H4FECDemod.SearchForTwoTone62B3G to track down rare overflow

Nov 4, 2013 0.1.7.0 Beta release if 0.1.6.1

Rick,

I noticed something when I sent a beacon today with version 0.2.1.0.
I'm not sure if this happened with the other versions or if it matters.
When I am transmitting my power meter fluctuates between 50 and about 25
watts. I am set on 50 watts. I am using a Kenwood TS-590 with the
built in sound card. I'm wondering if my signal is fluctuating on the
receive end. I've tested with Fldigi and it doesn't fluctuate.

Ron,

I made a small change on the amplitude of the sync character. It's peak amplitude is now 1.4 x the peak of the 4FSK character symbols.Since the Sync is a two tone signal (crest factor of 1.4) that actually translates to the SAME AVERAGE power but higher peak power. So if you had a peak reading wattmeter you will see about a 2:1 power fluctuation but an average reading meter will be fairly constant. I may play with this some more. Two reasons for running the sync at higher power:

1) It increases the tuning accuracy and framing precision in very weak conditions

2) If set correctly (so the Two tone test does not cause excessive ALC) it will reduce the average power down to about 50% and that is compatible with most amateur radios. You could overheat most amateur transmitters if you allowed 100% full power.

In general digital modes can often run over large crest factors .e.g. a large number of simultaneous PSK or FSK carriers can have fairly high crest factors .resulting in low average power. (you don't want the peak driving into ALC region or you get distortion).

4FSK modulation itself has a crest factor of 1.0 (Peak and average are the same) but 4FSK uses the two tone sync (which has amplitude variation) to help identify frame and symbol sync.

Thanks for the feedback,

73,

Rick KN6KB

Excellent progress, Rick!

I have yet to get on 10.123 with 0.2.1.0, beacon, and see if I can have a simplex QSO with it yet, however.
Perhaps this early evening as time permits..

I notice that graphically, the placement of the RX/TX data area of the main OS screen, relative to the logging area, is staying where I set it now between boot ups. Good!

I do however also notice that Windows is no longer remembering where I place the TNC display screen as it did in previous releases. It is now reverting to coming up in another spot on the screen each time I boot up, with it slightly overlapping the logging area of the main OS screen, requiring that I drag it to just above the RX/TX operating screen where I choose to have it located for maximum readability..

I'm looking forward to test driving this latest update Rick!

David,

Yes you can use click-to-tune on the waterfall display if desired. It is in the Chat help file (File, Help Index, Click-to-tune). Or of course you can manually tune the dial and the frequency display on the waterfall should follow…this frequency is saved to the mini log if you make an entry. The entire signal of interest must fit BETWEEN the green lines to allow auto tuning to work.

Working with the radio control/read back on the Yaesu radios is sometimes difficult. I don't have any here for testing and they tend to be different across radio models more so than Icom and Kenwood.

Peter,

Two different protocols Both are on the Yahoo V4Protocol FTP site.

1) V4 is a few years old It uses Viterbi encoded 4FSK and operates FEC or ARQ the Host program is V4Chat.

2) H4 (Hamming encoded 4FSK) is new still in beta. Currently FEC only but ARQ is in development. Host program is Chat. The objectives of H4:

Lower latency than PSK, Olivia, V4 about 200-300 ms vs 3-4 seconds for V4.

Narrow band (200 Hz @ -26 db)

Strong FEC (shortened 8:4 distance 3 Hamming encoding with soft minimal distance decoding)

Streamlined ARQ (in process) for low latency typing in ARQ mode.

Automatic ARQ CQ, ARQ Connect simplify initial connection.

Supports full international character sets: ASCII (7 bit), ASCII Latin-1 (8 bit), UTF-8 (8 or 16 bit)

I developed both modes as well as WINMOR used in several clients. Your comments and feedback welcome.

3697. H4 Protocol spec for FEC and ARQ posted to V4Protocol files section.

Yahoo group: V4Protocol
Date: 2013-11-27 11:04:30 UTC
From: Rick Muething
Topic: 3697 Message: 3697

All,

Many of us have heard the famous Abe Lincoln quote:

"Give me 6 hours to chop down a tree and I will spend the first 4 sharpening the axe."

The same still holds pretty well for developing a protocol!

I have made good progress on the H4 ARQ mode .initially mostly in the protocol spec. I have uploaded this to the files section (pdf) for anyone interested or having trouble getting to sleep. I have found that time spent "sharpening the spec" is well spent and makes the coding faster and with fewer iterations.

I am running special (I don't want to post these yet) Chat and H4FSK TNC test versions here that is sending both an FEC beacon and a new ARQ ID frame. You should be able to see a clean (no funny characters caused by the CRC check) ARQ ID after my FEC beacon. It is on 10123.0 USB dial and sends the short ARQ ID frame ("ARQ ID < KN6KB") a few seconds after the FEC beacon. Of course monitoring with FEC will not provide error checking or correction but it should be visible. I have gone to some effort to insure that monitoring of ARQ sessions can be done in both ARQ and FEC modes with clean printouts. This is all described in the "very interesting" spec.

I suspect it will be at least a couple of weeks before a fully functions (with a few bugs of course!) ARQ version is ready for testing. This includes the provisions (as you can see in the spec) for a second Reed-Solomon layer FEC on top of the Hamming encoding. This is used on the Robust Text and BINARY frame types.it reduces the frame payload some but should improve the net throughput (after repeats) in poor conditions.

I'll leave the beacon running today. I'm interested in how the ARQ ID frame "prints".

Have a good Thanksgiving.

73,

Rick KN6KB

Rick,

Thanks. Will read the H4 Protocol Spec and with regard to your 10.123 beacon, will report later. By the way, I have no problem sleeping but I do get up early (0200) to get my 1.5 hour regiment of exercise out of the way.

Have a super day and Happy Thanksgiving!

Rick, here's a screen shot of 2 of your beacons. The stuff before your beacon is just noise that got through. I was wondering why the start of beacon doesn't start on a new line. Also, what is the 1/4 at the end of the beacon.

Ron,

There are two things that are interesting.

1) The ¼ at the end of the ARQ ID is due to the CRC byte which actually should be suppressed since it is preceded by an End of Transmission I☐ll have to check that out. Of course in ARQ mode everything will be hidden unless it passes the CRC check sum.

2) The scalloping on your decode quality graph indicates possible large error in your sample rate. On the H4 TNC (after it has been running for several minutes) click Help and note the SR number at the bottom of the drop down. It should be fairly close (+/12 or better) to 12000. If it is far off your sound card has some significant error. It will still decode but can☐t be fully compensated. Let me know what you read for the SR value .(be sure and let it run the longer it runs the more accurate the reading)

3) The receive level looks low. With the receiver AGC on (medium to fast) it should be at least 50% of full scale. It looks like it is only half way on the blue scale which means you are using something like 8-9 bits of your sound cards A/D. That hurts the decoding accuracy and sensitivity. Shoot for at least mid scale or better and ☐in the green☐). You set this with:

a. The radio aux or speaker/phone output level (sometimes this is adjustable)

b. The pot and/or jumpers in the sound card interface. (e.g. the SignaLink has both an internal jumper and a RX pot.)

c. The windows mixer record level (if the sound card driver uses the windows Mixer.) You can check this with Start, Control panel, Sounds and selecting the card and record level that you are using for the radio.

Thanks for the feedback .It shows the ARQ ID is working but that ¼ should be suppressed. I☐ll find that this afternoon.

73,

Rick

Ron, All,

Thanks to Ron's feedback I found the bug that was not blanking out the CRC check byte from displaying in the ARQ ID frame.A simple fix which I have operating now. The concept is fairly simple .only adds one byte (128 ms) to these frame: A End of Transmission (Hex 04) is inserted just before the CRC check sum. The Check sum byte (which can be any 8 bit value based on the data) is then "hidden" since the station in FEC mode sees a EndOfTransmission character directly in front of the CRC byte. That EOT forces a monitor in FEC mode to stop processing characters so the CRC character is not shown. This should all work OK now. Stations using ARQ have a more complex capture, decode and display mechanism so can decode and compute the CRC check and basically ignore the EOT in the ARQ ID frame.

The only frame that this won't work for is the ARQ BINARY frame since by definition the Binary frame can include any of the 8 bit values and these may "print" in strange ways on a station monitoring in FEC mode. But pure BINARY data will always print funny since it contains all available 8 bit values.

73,

Rick KN6KB

Rick, I increased the USB output on the TS-590 and now the Rcv level is
1/2 way. The average SR reads 11999.90 so it's pretty close to 12000
and the Decode Quality line is almost a straight line. The CRC check
sum (1/4) is not showing up now with your fix. That was an interesting bug.

Ian,

We have been using 10123.00 and 28230.00 USB dial recently for the H4 protocol testing. Both V4 and H4 are 200Hz bandwidth @ -26 dB. The RF center frequency is 1.513 KHz above the USB dial.

Is anyone trying out this protocol this evening? (December 1, 2013). I just got it setup and would like to try it out before buying it. If so, what frequency? I'm located in upstate South Carolina USA.

3709. H4 ARQ Progress report.

Yahoo group: V4Protocol
Date: 2013-12-05 20:50:41 UTC
From: Rick Muething
Topic: 3709 Message: 3709

All,

I have been busy completing the H4 ARQ mode. I uploaded the current spec (rev 0.3.1) which is now quite complete (10 pages) including all protocol rules, Frame descriptions and State diagrams for both FEC and ARQ modes. It is a pdf on the Yahoo FTP server titled H4 FEC and H4 ARQ Protocol Spec. Reading the spec may be helpful if you are having trouble falling asleep! Having a good and detailed spec made the coding effort move along much faster and will be essential to anyone trying to port the VB.NET source code to another platform. (I don't plan on posting the sources until out of beta testing).

I have virtually all the ARQ code completed and am starting testing locally (across the desk). (Of course there were many short tests during code generation but with an ARQ system you can't get too far without all the code in place and having two systems to talk to each other!). The implementation is clean and should work out well. I have the binary transfer option coded in the TNC but that won't be enabled on the first release. (it will allow sending a named binary file in ARQ mode.with compression). I have tried to make the protocol as efficient as possible (running at about 66% of the FEC max rate which is pretty good as ARQ protocols go). An ARQ session can also be "monitored" by a user in FEC mode (with "clean" text printout.suppressing all the CRCs and frame ID characters) but can't of course correct all errors that the ARQ connection can. There are provisions for calling CQ in ARQ mode and a single mouse click to answer a CQ. It is also possible to call a specific station of course.

I expect to have something worthy of an alpha release in a week or perhaps 2. (remember alpha has bugs and should not be used by those without debugging skills!) The FEC mode will be essentially the same as the current H4 FEC mode now on the FTP site. The objectives initially are to debug the ARQ mode and evaluate its robustness etc. Bells, Whistles, Frills and Fluff won't be added until the basic ARQ mode is solid.

73,

Rick Muething, KN6KB

Does any out there use V4Chat for general idle ragchew qsos? I recall many qsos on or about 14.073 a year or so ago, now I hear nothing other than some of the other exotic digital modes. Is there a 20m or 40m frequency where stations generally place V4Chat calls??? I sure hope the new H4 and Chat gets more attention when it is released.

3718. Upated version of Chat 0.2.2.0 and H4 TNC 0.2.2.0 Posted on Autoupdate server and V4 Protocol FTP site

Yahoo group: V4Protocol
Date: 2013-12-21 03:18:30 UTC
From: Rick Muething
Topic: 3718 Message: 3718

All,

I have posted this major update on the Autoupdate server and also a full install on the V4Protocol Yahoo FTP site. The full install is also placed on the Winlink FTP site ftp://autoupdate.winlink.org/User%20Programs/ if someone has a problem with the Yahoo site.

This is a major update and while all the ARQ code and functions are in they aren't fully tested. So I have only enabled a few of the ARQ functions because otherwise it would just confuse everyone. I am leaving for a week on Monday so I only have this weekend to make any small updates.

This version now also includes a new more robust mode FEC RBST (Robust FEC) which has two levels of FEC (Hamming encoding inner layer, Reed-Solomon outer layer) for more robustness. This mode can be used to send large text files or multi cast broadcasts to multiple users.

The ARQ implementation is clean but it needs optimization for automatic round trip calculation and optimization along with expanded busy channel detection and the ever tricky IRS <> ISS exchange verification and optimization. There are however accurate State diagrams in the help and a complete H4 Protocol document on the Yahoo FTP site for those interested.

One feature I was able to make work is that it is now possible (independent of mode FEC, FEC FD, FEC RBST, ARQ) to display data from all modes. This will be very helpful and minimize most need for mode switching.

The Help files have all been updated and should be fairly complete now except for detailed operating instructions for ARQ.

You will see that two of the ARQ functions (ARQ Call and ARQ Answer CQ) are disabled in this release. I am still testing and optimizing these. You can "play around" however with ARQ ID and ARQ CQ (though no one can answer your ARQ CQ!).

The Beacon now is also sent using FEC ROBUST and should show fewer errors and if errors are uncorrectable will be shown in Red strike Thru text.

Your feedback is requested but I will probably not be able to do much for at least a week.

Please let me know if something that the help says should work is not. I know about the ARQ stuff. Also this is not yet the time for bells, whistles and fluff additions.let's wait until ARQ is working smoothly.

A Merry Christmas and Happy New year to all.

73,

Rick Muething, KN6KB

Topic: 3716 Message: 3725

I have done many V4 80, 60, 40, 30 and 20m. with a lot of LA and EU countries including Canada.
For me it has proven a good mode though limited to 7bit ascii.

Having a break some months due to my Windows PC crash and waiting for a new MacBook Pro Haswell, where I will try OSX Maveric and Win7Pro with VMWare both for RMS Express and V4/H4.

Plenty to do anyway attending our local Winlink servers and arranging winlink drills from other sites.

Also looking forward to H4s extension including ISO 8859-1, and the real international standard char set UTF8.

UTF8 has been proven to work excellent with VOAs Fldigi test broadcasts where even my old Mac PowerBook do work well.
English, French, Spanish, Russian, Greece, Chinese letters very well received, all just using the industry standard UTF8.
That is the standard setting for everything. (Except Winlink mail..8859-1))
Also off course the Norse letters working well.

I know of many norwegians waiting for information related to the new H4 mode when it's getting ready.

Amongst them also professional Pactor 1-3 users for years being astonished about the V4 abilities for ARQ QSOs which also reminds them of Amtor.

What will H4 reveal.....

73, thanks for Ricks work and Merry Christmas de LA7UM/Finn

3735. RE: KN6KB H4 0.2.2.0 Robust FEC beacon on 10123.0 KHz

Yahoo group: V4Protocol
Date: 2013-12-21 19:06:36 UTC
From: <esunetdude@...>
Topic: 3719 Message: 3735

Hi Rick,

I did the autoupdate and the 0.2.2.0 version is running. I found I needed to change the Auto Tuning Range to 40 Hz for anything to decode. I also dropped the squelch to level 3. I copy your beacon and a beacon from KK8G perfectly. I had a QSO with WB2LOU using FEC RBST mode. The curious thing is that the entire QSO had extra characters after each block of the message was received. But this does not happen when receiving the beacons and those are also using FEC RBST. It appears the FEC RBST for the beacon is different than the FEC RBST used in regular keyboarding.

73 (and happy holidays to all)
Doug, N3JXB

3736. RE: [V4Protocol] RE: KN6KB H4 0.2.2.0 Robust FEC beacon on 10123.0 KHz

Thanks Doug,

Well the tuning range just determines how far the tuning algorithm searches. Normally it should be 50 or above (that means if the station transmitting is within +/- 50 Hz of your dial it should tune and print… Setting it up to 100 will give you more tuning range but of course it could tune to an adjacent signal too. If you set much below 50 both stations have to have very accurate dials/oscillators. There is an indicator showing how far the other station is from you. + indicates the station is above your frequency.

Sending and reception of the beacon Robust text is exactly the same as normal Robust Text (keyboard or sending Files). I think what you are seeing is random sync detects which with the current logic will “print” in FEC robust mode. Probably I should change that making FEC robust mode only display FEC Robust or Monitored ARQ signals. FEC Robust uses specially tagged and formatted frames with a frame ID, a CRC check and a block of 8 Reed-Solomon second layer FEC. If I change that logic when in FEC Robust mode it should:

Print ARQ frames if received

Print Correctly received/corrected Robust FEC frames in Dark Blue bold type

Print uncorrectable Robust FEC frames in Red Strike-Thru text

Ignore (no print) of any random characters or syncs. (But it would also not print a normal FEC transmission either)

That would be an easy fix which I could get out tomorrow.

Thanks for the comments and feedback.

Rick KN6KB

3738. Announcing CATfix -- a Christmas present for Kenwood radio owners

Yahoo group: V4Protocol
Date: 2013-12-21 20:32:28 UTC
From: Ian Wade G3NRW
Topic: 3738 Message: 3738

ANNOUNCING CATfix -- a new Windows utility that controls IF Filter switching and configures the radio for digital working.

CATfix OPTIONS
~~~~~~
1. Switching between the IF Filters when using SPLIT:

CATfix monitors the radio's TF-SET button, and (optionally) toggles between IF Filter A and IF Filter B when you press and release the button. This is especially useful when chasing a rare DX station that is working split – you can set up a narrow filter to listen on the DX station's TX frequency and a wider filter to monitor around your own TX frequency, then automatically toggle between the two filters as you press and release TF-SET.

~~~~~~
2. Setting up the radio for digital operation:

CATfix provides several options that help set up the radio for digital operation. These options let CATfix automatically:

*** Turn off Auto Information, to prevent overloading the input to application programs.
*** Lock the radio's front panel, to prevent accidental changes.
*** Set the power level (typically to a few watts).
*** Turn off the audio processor.
*** Switch both VFOs to upper sideband.

~~~~~~
3. "Fixing" the "TX" command:

CATfix has an option to change the "TX" (or "TX0") CAT command issued by an application program (such as MMTTY or Ham Radio Deluxe) to "TX1". This ensures the radio uses the TX audio that is input to the USB or ACC2 port, rather than via the mic socket.

~~~~~~

All of these options are individually configurable.

CATfix was written specifically for the TS-590S, but most of the functions should also work with other Kenwood radios, including the TS-990S and TS-2000 (and possibly others).

CATfix does not require any changes to application programs, other than changing the COM port they usually use to communicate with the radio. There is no need to apply any software patches. You run application programs in exactly the same way as usual.

==========

For the CATfix software and User Guide, go to the "TS-590S Resources Page":

http://homepage.ntlworld.com/wadei/ts-590s.htm

Then click on the red "CATFIX" button.

==========

And finally, Christmas/Holiday greetings to everyone. May the New Year keep you in good health!

3739. RE: [V4Protocol] Upated version of Chat 0.2.2.0 and H4 TNC 0.2.2.0 Posted on Autoupdate server and V4 Protocol FTP site

Yahoo group: V4Protocol
Date: 2013-12-21 15:44:53 UTC
From: John Wiseman
Topic: 3718 Message: 3739

Hi Rick,

Is there a spec yet for the programmer's interface to the H4TNC?

Thanks,
John G8BPQ

From: V4Protocol@yahoogroups.com [mailto:V4Protocol@yahoogroups.com] On Behalf Of Rick Muething
Sent: 21 December 2013 03:18
To: V4Protocol@yahoogroups.com
Subject: [V4Protocol] Upated version of Chat 0.2.2.0 and H4 TNC 0.2.2.0 Posted on Autoupdate server and V4 Protocol FTP site

All,

I have posted this major update on the Autoupdate server and also a full install on the V4Protocol Yahoo FTP site. The full install is also placed on the Winlink FTP site ftp://autoupdate.winlink.org/User%20Programs/ if someone has a problem with the Yahoo site.

This is a major update and while all the ARQ code and functions are in they aren't fully tested. So I have only enabled a few of the ARQ functions because otherwise it would just confuse everyone. I am leaving for a week on Monday so I only have this weekend to make any small updates.

This version now also includes a new more robust mode FEC RBST (Robust FEC) which has two levels of FEC (Hamming encoding inner layer, Reed-Solomon outer layer) for more robustness. This mode can be used to send large text files or multi cast broadcasts to multiple users.

The ARQ implementation is clean but it needs optimization for automatic round trip calculation and optimization along with expanded busy channel detection and the ever tricky IRS <> ISS exchange verification and optimization. There are however accurate State diagrams in the help and a complete H4 Protocol document on the Yahoo FTP site for those interested.

One feature I was able to make work is that it is now possible (independent of mode FEC, FEC FD, FEC RBST, ARQ) to display data from all modes. This will be very helpful and minimize most need for mode switching.

The Help files have all been updated and should be fairly complete now except for detailed operating instructions for ARQ.

You will see that two of the ARQ functions (ARQ Call and ARQ Answer CQ) are disabled in this release. I am still testing and optimizing these. You can "play around" however with ARQ ID and ARQ CQ (though no one can answer your ARQ CQ!).

The Beacon now is also sent using FEC ROBUST and should show fewer errors and if errors are uncorrectable will be shown in Red strike Thru text.

Your feedback is requested but I will probably not be able to do much for at least a week.

Please let me know if something that the help says should work is not.&nbs p; I know about the ARQ stuff. Also this is not yet the time for bells, whistles and fluff additions.let's wait until ARQ is working smoothly.

A Merry Christmas and Happy New year to all.

73,

Rick Muething, KN6KB

Subject: [V4Protocol] Upated version of Chat 0.2.2.0 and H4 TNC 0.2.2.0 Posted on Autoupdate server and V4 Protocol FTP site

All,

I have posted this major update on the Autoupdate server and also a full install on the V4Protocol Yahoo FTP site. The full install is also placed on the Winlink FTP site ftp://autoupdate.winlink.org/User%20Programs/ if someone has a problem with the Yahoo site.

This is a major update and while all the ARQ code and functions are in they aren't fully tested. So I have only enabled a few of the ARQ functions because otherwise it would just confuse everyone. I am leaving for a week on Monday so I only have this weekend to make any small updates.

This version now also includes a new more robust mode FEC RBST (Robust FEC) which has two levels of FEC (Hamming encoding inner layer, Reed-Solomon outer layer) for more robustness. This mode can be used to send large text files or multi cast broadcasts to multiple users.

The ARQ implementation is clean but it needs optimization for automatic round trip calculation and optimization along with expanded busy channel detection and the ever tricky I RS <> ISS exchange verification and optimization. There are however accurate State diagrams in the help and a complete H4 Protocol document on the Yahoo FTP site for those interested.

One feature I was able to make work is that it is now possible (independent of mode FEC, FEC FD, FEC RBST, ARQ) to display data from all modes. This will be very helpful and minimize most need for mode switching.

The Help files have all been updated and should be fairly complete now except for detailed operating instructions for ARQ.

You will see that two of the ARQ functions (ARQ Call and ARQ Answer CQ) are disabled in this release. I am still testing and optimizing these. You can "play around" however with ARQ ID and ARQ CQ (though no one can answer your ARQ CQ!).

The Beacon now is also sent using FEC ROBUST and should show fewer er rors and if errors are uncorrectable will be shown in Red strike Thru text.

Your feedback is requested but I will probably not be able to do much for at least a week.

Please let me know if something that the help says should work is not.&nbs p; I know about the ARQ stuff. Also this is not yet the time for bells, whistles and fluff additions.let's wait until ARQ is working smoothly.

A Merry Christmas and Happy New year to all.

From: RICK WESTERFIELD
Topic: 3753 Message: 3754

H4 is more robust than V4 and somewhat faster. It is for text chat messaging rather than for the email and file attachment methods that WINMOR supports.

Winmor is faster mostly because it is wider though that is not the complete story here.

It is going to be tough to beat Pactor 4 in an SCS modem with that rock crushingly powerful DSP chip at a competitive price. A computer sound card will not do it so do not hold your breath. Winmor and RMS Express do very well in that effort though.

Rick, is the DSP chip in P4 Dragons a unique chip make special for SGS? Or is the same DSP chip commercially available, or is it also being used in other high-end sound cards?
You say a computer sound card will not do it, but a simple search turns up all these DSP sound cards that are even *more* expensive than the P4 ... examples here: http://www.zzounds.com/cat--DSP-Cards--2428 So, first, does anyone know exactly what the main DSP chip in the P4 is? Do the high-end sound cards use a totally different DSP architecture or technology? I'm asking questions to stimulate thinking. When I was younger I was taught that no matter how something is being done, "there is always a better way".

Hi Dave,

You are asking: "... is the DSP chip in P4 Dragons a unique chip make special for SGS?"

It is a quad core DSP chip from Freescale, 64 bit, 6400 mips. But the core of the process the P4Dragon is doing so well is not the chip, but the SCS algorithm. This one is not open source, but licenced when you are buying a DR-7800.

Dean, All,

One needs to understand what is really meant by DSP. The sound card (now days typically a $1-3 chip) simply samples the analog audio (or in some cases IF) from the radio and puts it into a stream of digital numbers (samples). After that DSP means that all/most the conventional things done in a radio (demodulation, filtering, etc.) are all done digitally instead of using analog components. The kind of things we do for digital protocols also includes other processing like decoding (e.g. Viterbi, Hamming, Reed-Solomon, etc.) and these things may be done with DSP or conventional programming. The dedicated DSP chips simply do arithmetic (mostly multiplies and adds) very quickly allowing more processing than is practical on a simple PC.

When you talk about a SCS TNC or a WINMOR TNC or any other popular protocol the “smarts” or proprietary nature is not in the chips or even in the basic DSP code itself (e.g. Filters or FFT). It is in the design of the protocol and the knowhow on how to implement it. That is the same proprietary mechanism that protects any software, OS, etc. Several years ago I was consulting for a Chinese company and was having trouble communicating (through an interpreter) to the owner why certain software costs so much. He kept trying to relate the value of the software to the $.25 CD it was distributed on. I finally made my point by holding up two CDs and saying one was blank and the other had the closing values of tomorrows stock market on it and asked him which he thought was the more valuable! (No I don’t know how to predict the closing values of tomorrows stock market!)

My understanding is that SCS is a private company. It probably has employee shareholders (owners) and perhaps investors that put up money (bought stock) that helped finance the development of these proprietary protocols and implement them. Those owners and stockholders have every right to charge for their product and to license it as they see fit. The marketplace then decides if their product and price is competitive and if the company survives or makes money. All this is basic capitalism. I think some that complain about proprietary nature of Pactor or other protocols simply don’t understand the basics of capitalism and the value of intellectual property. Anyone with the proper skills and willing to spend enough time can build a protocol and can then choose to sell it, license it or give it away. But the reality of this technology is unless you are one of the relatively few that has the skills and knowledge to do this and are willing to donate all your time you aren’t likely to give it all away. Protocols like Pactor 3 and Pactor 4 took MANY man years of professional engineering effort to develop, test and deploy. Most companies that I am aware of that choose to do this as a business are not likely to donate this kind of proprietary technology so anyone that can copy a CD or memory chip can duplicate it. I think those that complain about proprietary issues should ask what would I want if I were a stockholder in such a company.

So it is not an issue of DSP or sound card chips (there are many good low cost sources for these that can do what needs to be done) It is the effort of putting together every thing needed to make these work and implement a complex protocol. This intellectual property is where the value is NOT the cost of the chips.

73,

Rick Muething, KN6KB

Winmor is faster mostly because it is wider though that is not the complete story here.

It is going to be tough to beat Pactor 4 in an SCS modem with that rock crushingly powerful DSP chip at a competitive price. A computer sound card will not do it so do not hold your breath. Winmor and RMS Express do very well in that effort though.

How does the V4 or H4 protocol compare with Winmor 1600 in terms of speed and poor signal conditions? And *if* V4 or H4 is superior to Winmor 1600, why are we still using Winmor? And I'm new here, and know very little about these various protocols, but may I suggest that someone *please* develop a software based protocol that will be as robust as Pactor 4, or possibly even superior?

Rick,

I am perhaps one of the most capitalistic people on this board. For years I worked in engineering and later in purchasing for a metal products manufacturing company with roughly 600 employees. My actual title was Vice President, Purchasing. One reason for my transition into purchasing was that I realized that every business in the world, regardless of how small or large, is in business for one reason and one reason only, and that is to make a profit. And I questioned every purchase very carefully and analytically by asking myself the question, "How will this purchase contribute to the our company's bottom line?" So I agree with you completely that SCS has every right to make a decent profit on their tremendous investment in order to be justly compensated and rewarded for their efforts.

But we are hams, and this is not a business that requires and has profitability as a goal. As for myself, I enjoy the hobby, but I admit Ihave zero capability in electronic designs, mathematical algorithms, etc. But at the same time, I repeat, there has to be a better way. Perhaps there needs to be a better quality more advanced SignaLink USB, I don't know! Surely we all know that something better, faster, and cheaper will replace the Pactor mode of communications, so why not do it now rather than waiting ten years for it? Winmor is certainly a step in that direction, but I'm trying to encourage someone, or maybe a group, to go on to the next step up, or two steps up. That's why I was asking about V4 or H4. When I was a kid, all radios had tubes in them that had to warm up. Then came along transistors. But never mind all that!

Few best ways to know the advantage of Amazon coupon 10% http://amazoncoupon10percentdiscount.blogspot.in/2013/12/few-best-ways-to-know-advantage-of.html

Amazon is known for selling some of the best discounted merchandise and it is now possible to find some of the best and exceptional bargains with the help of coupons. With the help of these deals it is possible to add up some of the best savings even as you shop big on amazon merchandise.

Let us discuss how to save big with Amazon. For people who have never used the superstore for shopping, the initial step is to get themselves familiarized with how it works and what varieties of merchandise are sold here. Amazon, indeed sells everything from clothing to furniture’s to groceries etc.

After choosing what to shop from Amazon, the next important step is to find for amazon coupon ; this is a very basic deal from amazon and offers flat 10% off on merchandise. Other different ways to save money with amazon are to take advantage of its shipping discounts, percentage offers, buy one get one free offers etc. these coupons have their own barcodes and could be applied at the time of checkout process.

These amazon coupon 10% http://showcouponcodes.com/amazon/ could be located at both amazon website and from numerous third party websites that carry coupons of amazon and its competitors for the best benefit of their visitors. Users have to check out the amazon coupon code http://showcouponcodes.com/amazon/ on the home page of the website for specific discounts and they indeed could benefit with offer having as high as 70% discount. Amazon has other deeply discounted merchandise as well that are sold as part of their clearance sale. It is possible to save as high as up to 90% through this.

Thus, a little time and research could help people save in many different ways with Amazon.com and it is important to use these coupons then and there when they are still valid.

Hi Dean

I sometime park on 28.230. Also 10.123 like my Pactor keyboard friends we have a set freq we sit on. I know v4chat. We were sitting on 7073, and 14073.

If there was a PDF file or something one could download and keep handy it help us old farts that need a string around our keys as we forget where we put them.

I'm not on there at the moment.

Create a text file from with the program. Edit you may need to play with
the menu to get it to pull up notebook. Once you have a file

CQ CQ CQ de va7dgp pse kn

Save it.

Then in the menu User Files
it will allow you to copy paste and send it will transmit.

Or go to setup beacon. Add

CQ CQ CQ de va7dgp pse k
Or just leave it the same. Don't forget to check beacon for it to send your
beacon message

I've just open my chat and I'm on 28.230

See if you can copy.

3772. 28.230 Stations

Yahoo group: V4Protocol
Date: 2013-12-28 17:39:38 UTC
From: <esunetdude@...>
Topic: 3772 Message: 3772

So far I copied a PY3SS, Brazil, clearly. But I called and receive no reply. I also see and hear another station trying but cannot decode.

Slow but steady progress. I will continue to check periodically. My beacon is still running.

Doug, N3JXB

3773. Re: [V4Protocol] 28.230 Stations

From: Dean
Topic: 3772 Message: 3773

Ok, I was connected to the PY3SS station but, being new to the software, as he was (Mark, PY3SS) we really didn't know what to do. I am very accustomed to using HRD + DM780 and it has convenient Macros prepared, etc. I had to type my callsign in V4Chat etc. Is there an easier way? I switched back to my RMS Trimode station now in Winmor 1600 mode.
Thanks to everyone for helping!

Dean,

There are 2 programs, V4Chat and H4Chat. If you are using V4Chat and you see a call go to the pull down menu ARQ Call and enter the other station's call and press Call Callsign. The 2 stations should sync and connect. H4Chat is still in Alpha testing mode and you cannot connect. Just select FEC Robust and type your text in the bottom window and, depending on your set up, press CR to send the text. If another station copies you they can just send text back to you just like PSK31. The help section is very good and it will guide you on using both programs.

I just sent a beacon. I just heard some data but not strong enough to copy it.

Doug,

It's good to see another PA station playing with H4Chat. We are
probably too close to copy each other.

3776. confusing Yahoo Group info

Yahoo group: V4Protocol
Date: 2013-12-28 18:08:45 UTC
From: Ed
Topic: 3772 Message: 3776

I am a brand spanking new user for V4 Chat. I have the V4 program running, possibly successfully, but have a couple questions.

Are the frequencies of general usage listed as DIAL frequencies, or CENTER frequencies; e.g. should my radio be listening on 14073.0 USB Dial, or 14071.5 USB (14073 CENTER) ???

Secondly, in attempting to use the FILES section of the website I am having a bit of difficulty determining what files are old, and what are current. I see file dates going back to 2010, and I see some files with no year at all, just a month and a day. Any help on this would be appreciated. As it appears the new H4 protocol is in Alpha or Beta testing I'd like to try whatever is most recent.

Thanks.

FEC Beta full install version 0.2.2.0 Minimal ARQ functions enabled.

V4Chat Download is V4Chat 1.0.4.0 Full Install.zip
<http://f1.grp.yahoofs.com/v2/cBS_Um-Yy8gTU5t-l7sw8KBKEXGx33SgesvDst1OXEuGTEh6uWCifvlXxf3aPM2LN0ydJGizqY2gueyvMCt49Hmdq-lir98JnxWweWwaBpP2NfzrzMi0v8csYNyASlP9PTGnQyxsbRQMYcoA/V4Chat%201.0.4.0%20Full%20Install.zip>V4Chat
1.0.4.0 Full install with V4TNC and help.

H4Chat is in beta testing. You can help debugging it by using it and
reporting any problems. V4Chat is stable with the ability to connect to
other stations. Be sure to read the help section for very good
instructions on their use. The frequencies would be dial frequencies.

Hey Ron,

I would imagine we could work on 40 or 80 meters, even 160 if you have it. I think 80 or 160 would be the better choices. Let me know if you want to try a schedule.

Linus,

I have the same situation….just installed V4 Chat program, then realized that there is an Alpha test release of the better program, H4 Chat and downloaded that too. Now, I am not sure where to find other stations on the bands, and also am not sure if the majority are still using V4 Chat or are moving on to H4 Chat. Personally, I was planning on focusing on H4 Chat.

The frequencies I have seen referenced are: 28.230, 14.073, 10.123, and 7.073. I saw some H4 CQs being called by a California station yesterday on 10.123 but the station did not come back to my call when I responded.

KF7HYO -- I have been listening with V4 Chat, which is probably why I was NOT seeing you. This is a problem…. V4 is released but H4 is superior but still in Alpha or Beta test….. and they are not compatible with each other.

Just tried you on H4… I see you now! I responded with one message but I REALLY need go now so will try hours later.

I have been using robust. I move to fec as notice. Make up some text files
ie CQ CQ CQ
File on equipment etc. paste and send. As you notice I just sent data to
you about my setup. Makes it easier than typing every time you chat.

Got to run. If your lucky. You might pick up Peter oz1pmx. He's right into
data.

Yes, I find the same thing, which surprises me given the nature of this new keyboard mode. Unfortunately I will not be able to actively participate in these activities for the next couple months but expect to do so around April. Hopefully by then Rick will have released the complete version of the H4 Chat.

REPLY:

I would like to suggest a reason for that, at least in part.

There are too many new digital modes. Everybody and his brother develops a new mode and then writes umpteen versions of it and people wonder why there is little activity.

Right now the big three are RTTY, PSK31 and JT65. None of them have "versions", at least none that are popular. If you say "RTTY" people know you mean 45.45 baud, 170 Hz shift. Only in pre-scheduled circumstances will you hear anything else. PSK31 and JT65 are even simpler. There are no "versions" at all, at least none I'm aware of.

A plea to developers: Write something that is really better, not just different. Otherwise the mess will just go on forever. Do your beta testing with your friends, not with the whole world. Only when you truly have a new program in the same class as the big three should you release it to everybody. Thank you.

Grumpy mode off.

I agree, too many digital modes, and most of them are lacking. Even the most popular one, PSK31 sucks unless you have a perfect signal. I do not consider having to repeat every tidbit of information twice in order for the receiving station to copy it to be much of a digital communications mode. ARQ is the way to go and to the best of my knowledge there is no sound card based ARQ keyboard mode other than the one being developed by Rick. I eagerly look forward to it's completion and release

RRR Ed,

We here in "OH" = Finland are very active Multipsk ALE 400 ARQ FAE.
Working very well under poor condx and NVIS.
Also RSMF 8000 is very usefull if signal is good enought.
RMS Express/Winmor is very usefull too, also via P2P.
All this modes are tested inside Finland 160/80/40 meters HF/NVIS and also
50 MHz over QRB 150 miles.
Nice to test in future H4 ARQ versus ALE 400 ARQ, hi.
this is really modern HAM radio hobby!
73 to all over FEC/ARQ digital modes. OH7TE/5 "Yussuf"

Greetings Group

I feel it's more of the time zone difference. Most of the activity is on the east coast. It's sort of a desert on the west. To west water, to east land. To the north Alaska and the Arctic. To my south water. So I don't have much to choose from when bands are dead. When your operating. I'm working. When I'm Operating your sleeping. When I'm sleeping Europe is alive and well.

Having a file online or using hamspots.net to post your qrv and freq might help. Just my 00.2 Canadian worth. I don't always play with H4 or Vchat. I'm into packet and pactor and then work at the candy store gets in the way.

73

Happy New Year

Ed,

There are at least two other sound card ARQ modes.
1. ALE 400 in MULTIPSK
2 . HRI WINMOR which uses one of Rick's other tncs the WINMOR tnc. You can do either FEC mode or ARQ mode with it.

I have played with both.

You've goy to be kidding me?? ☐ I just took a look around at both programs....and could find next to no useful info on the HRI program, which doesn't appear to be something one can call CQ and keyboard with anyway ??
And as far as ALE goes, it seems hard to me to even make a comparison of that to the simple elegance and ease of use that Rick's Chat program has.

Just my first opinion. Maybe more research might change it.

GM Ed,

Well, I agree with you that MULTIPSK is a hand full. I've had it for a number of years but I don't use it all that much any more. It is kind of my 'goto' program if nothing else will decode a signal. I do use its CLOCK aux program to set my computer's clock to CHU time quite often.

As for HRI, Howard mostly designed the program for rig and shack control and threw in the Winmor TNC for conversing. For the most part the Winmor part works pretty well. I really haven't played much with the rest of the program as I don't have most of the equipment it was designed to control. Several of us suggested he pull the Winmor part out of HRI and make it a separate program but he didn't seem interested. May be I shouldn't say this, but I like it better than V4CHAT or now CHAT.

For some reason V4CHAT and CHAT have never 'felt' right to me. They are not 'intuitive' and you seem to have to 'force' things in the program. I think others may have gotten the same feeling as even though the mode in one form or the other has been around for several years, it has never caught on big time and development has been painfully slow.

I don't know if any ARQ mode is 'right' for the masses. Most operators don't seem to like the constant noise of switching back and forth between rx and tx and it puts a monkey on their backs to constantly have something to say or the program will time out the ARQ connection so over all an ARQ contact is not nearly as pleasurable as normal contacts. It's a bit more like runnng in a contest rather than having a 'chat'.

Anyway, that's take on things ARQ. FWIW.

Well, Dave, I must say my experience with Chat is apparently not the same as yours.....I find the program quite simple and intuitive to use. Rick's built in HELP filer is certainly a convenience for those who need it, too. The back and forth switching for ARQ does not bother me....(using IC 746pRO) but then again I am used to Winmor which I use extensively in our local ARES program. I guess time will tell ..... and perhaps a little publicity might help also. I recall the article in QST about JT65hf certainly seemed to boost usage of the JT modes.

From: <esunetdude@...>
Topic: 3814 Message: 3840

No way can JT65 be compared to real keyboarding in V4Chat and now Chat. JT65 is painfully slow, and quite limited in message content. As for ARQ control going between RX.TX, that is the whole idea. I was rather pleased to see the software managing the communications.

I think one thing that has been a problem is the new H4 Chat is not complete. Of course the author/developer has a career like most of us so these things come second. Once it is more complete and functional I would expect people to use it more. For now there are parts that are not complete. Another nice thing, possibly a new feature suggestion, is to have it broadcast an RSID at the start of a QSO or when in beacon mode. There are those not familiar with Chat and the RSID might help lead them identify what the signals are.

Finally, as for simplicity, Chat is absolutely going to need macro functionality. People using any of the various keyboard digital suites such as MultiPSK or fldigi have grown attached to their macros. I realize this is glitz that must wait until after the core functionality is established. But it really needs to be included.

GM Ed,

I've used RMSX for several years myself. Personally, I don't have a problem with the back and forth of CHAT but I do know operators that don't like the ping pong type of QSO.

Having used RMSX was one reason why I was excited to see a conversational version using the Winmor TNC (HRI Winmor). Also being involved in emcomm at the time I thought it would be ideal for use on nets and/or for passing traffic but Rick wasn't interested in adding a conversational mode to RMSX instead choosing to develop another mode (V4CHAT) for conversing because it was spectrally "more efficient" .

Having monitored many emcomm /traffic nets it seems a common MO is to call and run the net in something like Olivia 8/500 then, whenever they wish to pass traffic or maybe a bulletin, switch to something like MT63-1KL or something even wider for speed.
FLDIGI when set up properly with its suite of programs has made it almost effortless.

However all is not 'beautiful' when using that MO. If there are stations that happen to be close to the net frequency and maybe were there before the net started, they are suddenly getting bombarded by the wider mode's sidebands. Nice! :>(

With todays digital encoding and decoding it is possible for two stations to be next to each other with minimal interference but suddenly, if one of them gets twice as wide, things can get ugly! My point being that it would be nice to have one mode that could maintain its bandwidth, be good for chatting or
net operation and yet be efficient at passing traffic error free.

The Winmor TNC if implemented fully can do that. So what if it is 500 Hz. wide, so is Olivia 8/500 and it is used quite a bit for net operations and 'chatting'. Then you could have one program that can be used for chatting, net operation, passing traffic or, if needed, connecting with the Winlink system.

HRI's implementation of the Winmor TNC proves it works for chatting in both the FEC and ARQ modes (We have chatted and sent some big files using 'copy' and 'paste' with it) but it is not setup to work with the Winlink system. RMSX's implementation proves it works with the Winlink system but you can't chat or use the FEC mode. What we need is someone to build a nice GUI and supporting structure that uses the FULL potential of the Winmor TNC and call it a day.

Whether it would catch on in great numbers I don't know. There are still a lot of hams that are stuck on the 'one way at a time' routine of a normal QSO and find it hard to get use to the free wheeling dialog you can get with short bursts and ARQ. (Basically digital mode 'VOX' or 'QSK') It can be interesting and fun it you are chatting with someone that can handle it.

There is also a program BPQ (I think). I understand that it has incorporated the Winmor TNC in it but I am not familiar with it. Maybe someone else on here can tell us about it.

Anyway, all my comments are FWIW. :-)

hi Dave
i'm qrv HRI/winmor on 20m, 17m and 30m, but not much people here are active.
maybe you wud like to have a try with me ... just give me a sked .
I'm retired so i have much time for various tests
HNY and all the best Jean / F5FJ+

Dave,

To follow up on my just sent post, I must correct some of the things I stated of your comments. I see that you were referring to your use of RMS Express.....I had not recognized your abbreviation ' RMSX '. (not enough coffee here yet,). But my comments would apply to HRI.

Dave,

I am a little bit puzzled at your reference to a " ping pong " QSO using Chat, yet you seem to extol the virtues of Winmor TNC which also uses ARQ. While any transmission using an ARQ mode will have the transmitter switching to receive periodically to check for errors back, as far as I am concerned it is invisible to the operator whose only issue should be the typing of his conversation.

As I have indicated before, I do not like to either have to guess what a digital operator was sending me when there are errors in the transmission or having to ask for a repeat....thus in my view ARQ is the way to go for ham digital transmissions, and with the expected completion and polish of Chat, that appears to be the keyboarding program I am looking for to replace the likes of PSK31.

The fact that psk users have become attached to their macros might be a good reason to leave them off of H4 chat.

Subject: Re: [V4Protocol] Scheduled Activity

No way can JT65 be compared to real keyboarding in V4Chat and now Chat. JT65 is painfully slow, and quite limited in message content. As for ARQ control going between RX.TX, that is the whole idea. I was rather pleased to see the software managing the communications.

I think one thing that has been a problem is the new H4 Chat is not complete. Of course the author/developer has a career like most of us so these things come second. Once it is more complete and functional I would expect people to use it more. For now there are parts that are not complete. Another nice thing, possibly a new feature suggestion, is to have it broadcast an RSID at the start of a QSO or when in beacon mode. There are those not familiar with Chat and the RSID might help lead them identify what the signals are.

Finally, as for simplicity, Chat is absolutely going to need macro functionality. People using any of the various keyboard digital suites such as MultiPSK or fldigi have grown attached to their macros. I realize this is glitz that must wait until after the core functionality is established. But it really needs to be included.

Dave, I must be missing something. What does the desire to have macros have to do with PSK operators and HAM4 Chat? I frequently operate multiple digital modes, including Olivia and RTTY, and some PSK. The QSO's can get lengthy with some going more than an hour, The macros are a useful tool in the QSO. I notice the same thing with the operators I am having the QSO with. Examples of useful macros are a standard greeting, QTH and name, and a 73 macro that logs the QSO and invites SWL feedback. I fail to see how including a tool for these might be a bad thing. And some of the apps that have these are nothing at all to do with PSK. Look at MMTTY as an example.

I just got V4 installed.

A few basic questions

What kind of power are folks running 5, 10 or watts more?

I was trying to find the frequencies for V4Chat and found the following are these close?
80 m: 3.583 MHz USB, 3.590 MHz USB (EU)
40 m: 7.073 MHz USB, 7.040 MHz USB (EU)
30 m: 10.131 MHz USB, 10.136 MHz USB
20 m: 14.073 MHz USB
17 m: 18.085 MHz USB, 18.103 MHz USB
15 m: 21.073 MHz USB

Hi Doug,

In defense of Dave, (not that he needs defending), I think where Dave is coming from may be due to the over use of macros. I've found this to be especially true with a lot of PSK ops. As a matter of fact, I will very quickly conclude a QSO if the other party is constantly depending upon use of macros. For me, this makes a QSO boring! Now then, having said that, I do believe that macros are a great tool and very useful but not when they are over used. Within V4 and H4, you can create and save any script you choose. This certainly isn't macros but using this method is quick and easy.

Agreed with dave and you ... some ops only type "f1" "f2" "f3" (starting their macros) and that is all for a qso (a friend made psk qsos while driving to work with just sending out his macros) ...

But that is not a "chat" ... it is just like in a contest ... fivebyninethenextoneplease

Macros are a good thing to have .... (for station info or other things) ... but needed??? No

(you can just have some texts prebuilt and send them out ... but not with an "f"-button ... with just copy and paste (windows)

That's what I've done. I have a text for CQ as I have call sign 3 times. I
also have a file for equipment etc that I'm using.

If we had a posting on the web that would have the freq for each band like
we have for Pactor. 14109, 18111, 21111 etc. new comers as well us old guys
who have to keep cheats sheets to remind them of what freq.

Just a thought.

From: W6IDS
Topic: 3814 Message: 3851

Just to comment, I don't use macros all that much. . . just CQ, Testing, and inserting ahead of my next commentary section (hiscall de mycall). Sometimes, I use a "73" macro. . . . maybe. I insert info about the station sometimes, but only manually, by hand, and briefly.

But, more commonly, I type everything else in real-time. Perhaps that is a little problem for other operators who cannot "touch type." So, to keep up with the pace of the contact, they resort to relying upon macros, especially if they do not use English as a working language when connecting to American stations. If I was interested in working Italian, Japanese, French stations in the native language I'd actively use macros for most of the connection content, just to have the contact.

If you use a copy 'n paste method, that really is no different than using the "f" key to insert the text, IMHO of course. I think THAT is more work.

Including my own personal comments with live typing can be really difficult if I find that the other station is responding with one word answers or that macros are appearing everywhere. Or, I might be typing about the WX and location, why I'm on at that moment, and I get back a signal report, name, QTH and then it's my turn again. (Well, same thing happens with voice too)

If you can read/speak the language involved, can type, I think one needs to actually "participate live" in the normal, daily, connection and express your comments by typing them, even if using the "type-ahead" buffer. That's called communicating with conversation, sharing thoughts and experiences in an act that is very dangerous too. A one-on-one connection, something that is truly now becoming a very real lost art.

That's why I don't rely upon cell phone TXTing too much, tweeting never, face book never, and macros infrequently <GRIN>. A keyboard chat with V4, PSK, RTTY, Pactor, Amtor, etc will find you talking to ME, time consuming though it might be, for the absence of conversation macros. <GRIN>

BTW, WHY are V4 connections held in an "abbreviated format" anyway? It seems like there's an effort to mimic the TXTing done on a cell phone.

The psk frequencies and mode tend to have shorter qso's. Qsos that are mostly an exchange of
buffers are more likely to be found there. If you have had a busy day at work and need something less challenging, ok. I would like my qsos pre-sorted.

Dave, I must be missing something. What does the desire to have macros have to do with PSK operators and HAM4 Chat? I frequently operate multiple digital modes, including Olivia and RTTY, and some PSK. The QSO's can get lengthy with some going more than an hour, The macros are a useful tool in the QSO. I notice the same thing with the operators I am having the QSO with. Examples of useful macros are a standard greeting, QTH and name, and a 73 macro that logs the QSO and invites SWL feedback. I fail to see how including a tool for these might be a bad thing. And some of the apps that have these are nothing at all to do with PSK. Look at MMTTY as an example.

Those for whom English is difficult might be happier with a slower mode. 32 tone 1000 hz olivia is a good dx mode, and is quite slow. And for those of us for whom both English and typing are easy, we can get a cup of coffee while the buffer is emptying.

You are more likely to find the short ones with psk31. Longer ones with other modes. Longest qsos are found on 14.1075 using 32 tone 1000 hz Olivia (if you can find someone there).

What I generally find is PSK operators like/want are a very short and quick QSO. Swap name, QTH and signal report. Very rarely do I find PSK ops that want to really keyboard. The same is true for RTTY. When I get to Olivia, Contestia, Dominoex, MFSK, etc. the QSO is longer and more than a name and signal report exchange.

In replacement of macros, this idea of putting the information in a text file and then doing a copy/paste got me thinking. How difficult would it be to support a drag and drop where the file contains the text and once dropped on H4 chat window the text would be pasted in. That might hit the mark.

I agree with ED, ARQ is a great way to go. Rick's V4Chat program makes for a great "ragchew" mode and allows even slower typists to enjoy keyboard qsos. ALE400 is another awesome ARQ mode which I do not feel has been discovered by many or they turned away from it because they felt they had to join a group of hams that dedicate their radios to specific frequencies and having to scan various bands using a mutiband antenna under somewhat of a strict protocol. Not necessarily so. ALE400 "the mode" itself can be used for very long-winded qsos. I warmly welcome anything and everything that Rick, KN6KB is developing that attempts to promote more interest in the hobby. As for the folks that preferto use PSK31 with their macro files...that's ok too..I think they do a great job of staying pretty much down on one center frequency and take advantage of the narrow bandwidths. The way I see, for the most part, everyone down on the digital portion of the bands are having a good time while others are up on the phone bands arguing over who has the BEST AUDIO and STRONGEST SIGNAL.. It was a sad when the code requirement was abolished. LONG LIVE THE DIGITAL MODES...

Dean,

Yes it is called WINLINK!

V4 and H4 chat are intended to send keyboard text or small text files. To send actual messages you need:

A way to address a message to a particular user.

A way to route the message to a user if he is not connecting to the same BBS

A way of encapsulating an attachment or a file.

A forwarding protocol to set up unique message numbering scheme and to exchange what messages to forward. E.g. like FBB

This is all considerably more work than even developing V4 or H4. And besides Winlink already has a mode (WINMOR 500) that is more robust and faster than V4 or H4 and all the above stuff is done, tested, and operational.

Programs created for chat or keyboard operation generally are optimized for different things.

You might however check and I think BPQ 32 can be setup to use V4 but I am not sure. You might check with John Wiseman on if that is available and how to do it. H4 does not yet have full ARQ so cannot be used by a message system that requires accuracy.

A Ham friend in Paraguay and I have been using V4 Chat mode in ARQ very successfully. Now we would like it to have a Mailbox so we can leave a message if either of us is not in the shack, but it doesn't. Does anyone know of a CHAT program with a built in mailbox that uses a sound card mode like Winmor?

Thanks!

Thanks, but I'm not sure I made myself clear. We want a direct p2p mailbox in Winmor mode. With V4 Chat, we connect and if one is not present, I suppose I could still send a message and he could see it on the screen later, but that is not quite the same as a mailbox. And with Winlink, I'm not aware of a built-in mailbox that can be used directly between two stations. Am I missing something? So, yes, I agree Winmor is more robust and we would like a mailbox that simply works between two stations using Winmor. Winlink, as I understand, is a worldwide radio messaging system, but is not a direct mailbox - as in computer-to-computer - between only two hams. Correct me if I'm wrong.
**
I'll check with John about BPQ32, although I think that is a more complicated setup.

Dean,

If you want a direct mail box in WINMOR mode simply use RMS Express peer to peer. It is designed for messages. It uses an existing and robust forwarding protocol B2F with WINMOR (500 or 1600) and it can run Peer to peer to drop off individual mail to the party/call sign connected to.

Read the instructions on RMS Express Help, Help Contents, Operation, Making a Peer-to-Peer connection. Please, there are hundreds of man-hours that go into writing and maintain the help file. Save yourself and others time by getting familiar with it!

Dean,

The WINMOR P2P mode can do most of what you want. If you and your friend leave your rigs on a specified frequency with RMS Express running in the P2P mode, If station "A" has a 'peer to peer' message in his OUTBOX addressed for station "B" and tries to connect with station "B", the two stations will connect and send the message to station "B". Once station "B" has the message correctly, it will disconnect with station "A" and resume listening. The message will stay in station "B"'s INBOX until the operator does something with it.

Does that help?

Dean,

NO. That is one of the weaknesses of the WINMOR / CHAT combination. It takes two programs to do what you want to do. :-(

If you want chat and mailbox functions in one program then you need
bpq32, it works in V4 WINMOR PACTOR PACKET etc.
Because it is designed to work as a node in a network it will have more
functions then you need for just P2P but you can always leave those
functions unused without any problem.
Offcourse flexabilety comes at the price of a slightly more complicated
setup proces.

Dean,

Anything sent by RMS Express has to be in the form of an email. If you can compose short quick emails you can 'kind of ' chat. I have done that a time or two just to try it out but it is a bit cumbersome and usually a lot slower than a normal 'chat' mode would be. At least it was for me.

Dean,

RMS express is already a very complex and large program. Throwing in stuff like Chat modes, support for more protocols etc. is in my opinion trying to make it the does-everything Swiss army knife. How about Facebook and Twitter support?..that will be next!

The problem is when it does everything..

It is very difficult to maintain ..remember we are volunteers .there is no paycheck and we all deserve some occasional time off.

It is very difficult to learn..users already don't read the help.Chat mode will be just one other major function that needs to be explained and too often spoon-fed to those unwilling to read the help.

If people were willing to pay $100-200 per copy of RMS express there would be income to pay good programmers and engineers, have good support and better maintenance, but..Most hams still believe all software should be free and supported for free cradle to grave..not very realistic for today's complex software.

A wise programmer once commented..Most software dies of indigestion and not starvation. This Is very true! One has to be careful not to overfeed the golden goose!

Rick,

I agree with you! And I also have read *most* of the help files, but the help files are *huge* too! I'm not meaning to complain about RMS Express or V4 Chat, but rather simply trying to find a software, if it is available, that would do chat and serve as a mailbox too. Perhaps I am the only one that feels this need for software like this. Perhaps the internet has taken over most amateurs lives and they don't feel the need for using amateur radio as much as before. But I like to be prepared in case of an internet outage, and that possibility does exist. I got used to various modes during the nineties using my PK232MBX, DSP-2232, and other TNC's with mailboxes...I guess I'm spoiled and now I don't want to go back to using TNC's!!! I like my SignaLink USB! Rick, I for one, and I'm sure the amateur community thank you for all the excellent work that you do.

Topic: 3814 Message: 3874

Dave. Many norwegians have expressed a serious wish that the RMS Express could do K2K WINMOR, and Pactor, just as AirMail can do K2K Pactor. For the simplicity for the user without needing to install a bunch of other programs. This especially for boaters. And just live with it not being "slick" or ideally quick enough.
They can then move to V4 for more efficient QSOs.

This gets more and more important as Winlink prepare for Inet outages, so P2P or even K2K might be more important getting to someone who can reach a Hybrid Server.

GM Ed,
Well, I agree with you that MULTIPSK is a hand full. I've had it for a number of years but I don't use it all that much any more. It is kind of my 'goto' program if nothing else will decode a signal. I do use its CLOCK aux program to set my computer's clock to CHU time quite often.
As for HRI, Howard mostly designed the program for rig and shack control and threw in the Winmor TNC for conversing. For the most part the Winmor part works pretty well. I really haven't played much with the rest of the program as I don't have most of the equipment it was designed to control. Several of us suggested he pull the Winmor part out of HRI and make it a separate program but he didn't seem interested. May be I shouldn't say this, but I like it better than V4CHAT or now CHAT.
For some reason V4CHAT and CHAT have never 'felt' right to me. They are not 'intuitive' and you seem to have to 'force' things in the program. I think others may have gotten the same feeling as even though the mode in one form or the other has been around for several years, it has never caught on big time and development has been painfully slow.
I don't know if any ARQ mode is 'right' for the masses. Most operators don't seem to like the constant noise of switching back and forth between rx and tx and it puts a monkey on their backs to constantly have something to say or the program will time out the ARQ connection so over all an ARQ contact is not nearly as pleasurable as normal contacts. It's a bit more like runnng in a contest rather than having a 'chat'.
Anyway, that's take on things ARQ. FWIW.

You've goy to be kidding me?? ☐ I just took a look around at both programs....and could find next to no useful info on the HRI program, which doesn't appear to be something one can call CQ and keyboard with anyway ??
And as far as ALE goes, it seems hard to me to even make a comparison of that to the simple elegance and ease of use that Rick's Chat program has.

Just my first opinion. Maybe more research might change it.

Ed,
There are at least two other sound card ARQ modes.
1. ALE 400 in MULTIPSK
2 . HRI WINMOR which uses one of Rick's other tncs the WINMOR tnc. You can do either FEC mode or ARQ mode with it.
I have played with both.

>activity on the v4 / h4 frequencies. Is anyone else finding the same thing?

REPLY:

I would like to suggest a reason for that, at least in part.

There are too many new digital modes. Everybody and his brother develops a new mode and then writes umpteen versions of it and people wonder why there is little activity.

Right now the big three are RTTY, PSK31 and JT65. None of them have "versions", at least none that are popular. If you say "RTTY" people know you mean 45.45 baud, 170 Hz shift. Only in pre-scheduled circumstances will you hear anything else. PSK31 and JT65 are even simpler. There are no "versions" at all, at least none I'm aware of.

A plea to developers: Write something that is really better, not just different. Otherwise the mess will just go on forever. Do your beta testing with your friends, not with the whole world. Only when you truly have a new program in the same class as the big three should you release it to everybody. Thank you.

Grumpy mode off.

From: <la7um@...>
Topic: 3876 Message: 3876

New problem for me. IC 706+Signalink+manual freq tune XP Pro = never a prob.
IC7600 and Win7Pro implies no joy changing between RMS Ex and V4Chat.

I was called upon for helping making the Oslo Ham group main station QRV in those modes RMS Ex, V4Chat and AirMail.

Internal USB, updated driver, filter set, freq set and PTT all done through the USB cable.
WINMOR in RMS E working No prob.
Also Excellent with a added PTC2Pro and a real serial port for connection to the serial port on the PTC.
Only cable from PTC to Rig ACC1 was the 8pin sound/ptt cable.
Freq controll via external USB (CIV com port), NOT trying internal frq controll form the PTC.

Installed AirMail as well still using PTC2Pro and the same real Serial Port, and Freq change via the same USB (CIV Com port).

All working excellent. Shutting down one program, and starting the other.
Offers me K2K as well in Pactor modes.

Wanted adding the V4Chat. Here the MESS started.

I found NO way making it work. No help in the obvious shutting down of RMSE and / or AirMail.

V4Chat made a Mess of the setup of RMSE.
Or the other way around.
I did not find any way finding a working port set up for RMS E OR V4, since both freq controll and cat CIV PTT is done to the same Rig.

I ended up uninstalling V4Chat for offering them a Well working "klient proof" system. (I checked the Icom Adress and speed 19200 as well, even if getting tired after 4 hours of work.) I HOPE I did some obvious errors, but don't know.

What NOT tested yet was a full REBOOT between any change between RMS E and V4CHAT. IF that helps, it will probably be too cumbersome for users.
Not needed switching between RMS E and AIrMail 3.4.062.

At home with Signalink and manual freq controll, I can run RMS E Winmor, V4Chat and FLDIGI all QRV for listening at the same time and will not leave such a setup for my private use.
Automatic FREQ change off course not working, but is no big deal compared to the huge advantage of simultanuous QRV.

But for the club clients, or for boaters, I wonder: Either K2K WINMOR option, even if not slick (and K2K Pactor option) is needed within the SAME PROGRAM using the SAME COMPORTS after finally found a setup working for a crucial program, by means of ELMERS.

What did I do wrong?
If I did it all correct, I wonder if introducing WINMOR CHAT, V4CHAT (or H4Chat or whatever future may introduce) as an integrated part of RMS E may be needed for avoiding the port conflicts using those new rigs for secure use by new eager, but unexperienced digimode clients enthusiasts.

I still get requests from fellow countrymen about some easy K2K ARQ soundcard (and Pactor) option WITHIN RMS E. Hence my V4 Try since knowing it works well with SignaLink.
I have also got an old experienced army Amtor and later Pactor specialist getting very enthusiastic about V4, and done many ARQ tests.

This is no issue for a RMS Trimode special Server station running IC7200, or any other dedicated modern soundcard radio TS590 or whatever.

Issue is for new CLIENT use? And always new ones......

Anybody having a good guideline?
I don't like that I failed finding a way out of this probably com port mess.
Intention was not and is not running simultanuous with those new rigs, but one at a time without the need of rebooting PC in between.

Finn,

I just don't have any time to work on this now. The two programs are not incompatible…but you cannot run them from same directory or at the same time if they are accessing the same sound cards and/or COM ports. This is a Windows restriction and without it there would be sheer chaos!

Dave,

Yes in some situations you can access the sound card for receive on two applications simultaneously….And WINMOR or V4 will allow this too. But if the programs transmit or manipulate certain sound card settings it will fail. COM ports cannot be access simultaneously unless they are special dual port receive only ports (sometimes used for example to stream GPS data to two virtual ports) but these have to be set up and installed as dual ports with a special driver.

It is hard enough to write reliable code with the limitations of the sound card not alone trying to simultaneously share it with another real time application.

Rick. Understand the swamped issue. I tried installing V4 by default directories. Didn't check where RMSE was sitting, probably default. Intention only running one at a time. Next opportunity in some weeks may let me try other directories with the IC 7600 and WIN7.

My old private setup, when saying QRV, I meant just listening. V4 in Fec mode.
RMS E Winmor seeing waterfall, and in WL2K mode.
This perhaps being dangerous now when others may call me P2P even if I sitting in WL2K mode.
Also eventually just listening with FLDIGI and V4. All by same Signalink, manual tune so no comports involved.

I just don’t have any time to work on this now. The two programs are not incompatible…but you cannot run them from same directory or at the same time if they are accessing the same sound cards and/or COM ports. This is a Windows restriction and without it there would be sheer chaos!

Subject: [V4Protocol] IC 7600+RMSExpr+AirMail+V4Chat

New problem for me.
IC 706+Signalink+manual freq tune XP Pro = never a prob.

IC7600 and Win7Pro implies no joy changing between RMS Ex and V4Chat.

I was called upon for helping making the Oslo Ham group main station QRV in those modes RMS Ex, V4Chat and AirMail.

Internal USB, updated driver, filter set, freq set and PTT all done through the USB cable. WINMOR in RMS E working No prob.

Also Excellent with a added PTC2Pro and a real serial port for connection to the serial port on the PTC.

Only cable from PTC to Rig ACC1 was the 8pin sound/ptt cable.

Freq controll via external USB (CIV com port), NOT trying internal frq controll form the PTC.

Installed AirMail as well still using PTC2Pro and the same real Serial Port, and Freq change via the same USB (CIV Com port).

All working excellent. Shutting down one program, and starting the other.

Offers me K2K as well in Pactor modes.

Wanted adding the V4Chat. Here the MESS started.

I found NO way making it work. No help in the obvious shutting down of RMSE and / or AirMail.

V4Chat made a Mess of the setup of RMSE.

Or the other way around.

I did not find any way finding a working port set up for RMS E OR V4, since both freq controll and cat CIV PTT is done to the same Rig.

I ended up uninstalling V4Chat for offering them a Well working "klient proof" system. (I checked the Icom Adress and speed 19200 as well, even if getting tired after 4 hours of work.) I HOPE I did some obvious errors, but don't know.

What NOT tested yet was a full REBOOT between any change between RMS E and V4CHAT. IF that helps, it will probably be too cumbersome for users.

Not needed switching between RMS E and AIrMail 3.4.062.

At home with Signalink and manual freq controll, I can run RMS E Winmor, V4Chat and FLDIGI all QRV for listening at the same time and will not leave such a setup for my private use. Automatic FREQ change off course not working, but is no big deal compared to the huge advantage of simultanuous QRV.

But for the club clients, or for boaters, I wonder: Either K2K WINMOR option, even if not slick (and K2K Pactor option) is needed within the SAME PROGRAM using the SAME COMPORTS after finally found a setup working for a crucial program, by means of ELMERS.

What did I do wrong?

If I did it all correct, I wonder if introducing WINMOR CHAT, V4CHAT (or H4Chat or whatever future may introduce) as an integrated part of RMS E may be needed for avoiding the port conflicts using those new rigs for secure use by new eager, but unexperienced digimode clients enthusiasts.

I still get requests from fellow countrymen about some easy K2K ARQ soundcard (and Pactor) option WITHIN RMS E. Hence my V4 Try since knowing it works well with SignaLink.

I have also got an old experienced army Amtor and later Pactor specialist getting very enthusiastic about V4, and done many ARQ tests.

This is no issue for a RMS Trimode special Server station running IC7200, or any other dedicated modern soundcard radio TS590 or whatever.

Issue is for new CLIENT use? And always new ones......

Anybody having a good guideline?

I don't like that I failed finding a way out of this probably com port mess.

Intention was not and is not running simultanuous with those new rigs, but one at a time without the need of rebooting PC in between.

Dave, you don't mention which soundcard. IC7600 for WINMOR and V4 may be quite different than just one SignaLink and no comports involved if going manual with no CAT freq control and (Vox) PTT for parallell Listening only.

Interesting with the different directories trick.
Rick mentions the same. Giving me hope for ONE at a time.

Dave. Hm.. Is it both programs using the External soundcard?, or one using the external and the other using the rig Internal USB soundcard?.

I tried using only the Internal for both programs, but one program at a time.

I just got a report that some test and log program that I was not aware of had been affected as well by the V4 experiments, so they are working on that now themselves.

Later on I guess RMS Express ONLY, but without V4, might be tried again with priority to co work with their test and log programs. Whatever that is. Same PC and Rig, but off course one in use at a time.

The rig and HW installation is so good that it is worth some work making this work for both participants and owners of that group.

Hello Ben – WY4D

Thank you for your E-Mail message and also the QSO we had on 40 meters last night on 7.073.00 MHz H4FSK.

I was running an IC 756 Pro III / 9 Watts output to a 40M Inverted Vee and for the higher bands I run a 3 Element SteppIR yagi.
Just got on the computer and saw your message , will try to see if we can connect on 20 meters 14.073 MHz.

Still having trouble understanding the connect procedure from what I am reading under HELP.
Hope to connect on 20M !

V4Chatters

If I had access to QST Mag I'd look. It's been awhile (Couple of Months) since I played. I just may load up V4 at the shop and see what's happening on the band

I would have to disagree on thinking Facebook is more efficient. Everyone uses email and has access to a browser. People wouldn't be reading any of this if they didn't have those things. Facebook is just a gimmicky thing to sell airtime to mobile phone users. So please keep the information posted here, IMO.

I know the moderator did not want an avalanche of repetitive nay-sayers regarding FB but I must say this is really refreshing. For the longest time, I had always felt that I was “odd man out” in my disdain for the public venue – running contrary to what seemed to be accepted social convention.

It’s certainly off-topic but quite a relief to be honest. Certainly an eye-opener. Apologies to Rick and the Doctor. I won’t continue the thread myself.

From: John Ragle
Topic: 3941 Message: 3941

CHAT and the virtual TNC seem to work fine on my Elecraft K3, except that the click-tune feature does not work for me.

I have been using W1HKJ's "FLRIG" with the H4FSK, to give me on-screen tuning and control instead of mechanical knob-twisting from the K3. FLRIG complains that it cannot find the COMM port, but works anyway. I am running through a SignaLink box.

WRT "robustness" my take is that at 200 Hz width, H4FSK is /much/ more vulnerable to adjacent channel interference than, e.g. BPSK31 with its narrow "window." The conventional PSK windows (nn.070-nn.073 MHz) are nowadays very full, and finding a 200 Hz open channel is very unlikely. WRT "robustness" in the weak/noisy channel sense, there does not seem to be enough activity to test this aspect, as all the signals I have copied have been much stronger than the noise background.

WRT the nn.073 MHz "watering holes" mentioned by Steve Ford in QST, there is all sorts of other non-psk activity centered here which stomps on the H4FSK input side.

I have had several QSOs using this program suite; many thanks to those with whom I've had contacts. Signal strength reporting is the same problem as with PSK. Single-button "macros" (as in FLDIGI) are lacking and sorely needed.

I would like to hear from others about their experiences with CHAT/H4FSK.

From: <bradm75@...>
Topic: 3847 Message: 3949

This is a fairly good set of questions and I'm surprised there were no answers.

It would be helpful if the "standard" frequency for each band were listed in the Group Description. This is helpful to new users of the mode and hopefully will lead to fewer folks asking the same question over and over.

The other really good question Jim asked pertained to expected power output. Since this is a rather robust mode, I suspect that QRP is desired, but like any mode, you should only use what you need to in order to get your message through. So if you need to be using 100 watts, you need to. If you can get by with 50mW, then by all means only use 50mW. Since it seems to be a rather high duty cycle mode, I would expect that the lower power you can use, the better...regardless of courtesy to your fellow amateurs.

I have been out of town...so the slow reply.
I forgot to mention that the order of loading makes a difference. I have to load Ham Radio Deluxe first, and then FLdigi. I can run both on the same soundcard, but use a different sound card for two meters.

FLmsg sends ist text to whatever FLdigi programs are running, so if you are running one on two meters and another on h.f., you will bring up both instances. Not often that this would be desirable.

Dave. Hm.. Is it both programs using the External soundcard?, or one using the external and the other using the rig Internal USB soundcard?.

I tried using only the Internal for both programs, but one program at a time.

I just got a report that some test and log program that I was not aware of had been affected as well by the V4 experiments, so they are working on that now themselves.

Later on I guess RMS Express ONLY, but without V4, might be tried again with priority to co work with their test and log programs. Whatever that is. Same PC and Rig, but off course one in use at a time.

The rig and HW installation is so good that it is worth some work making this work for both participants and owners of that group.

Finn,

I just don’t have any time to work on this now. The two programs are not incompatible…but you cannot run them from same directory or at the same time if they are accessing the same sound cards and/or COM ports. This is a Windows restriction and without it there would be sheer chaos!

Subject: [V4Protocol] IC 7600+RMSExpr+AirMail+V4Chat

New problem for me.

IC 706+Signalink+manual freq tune XP Pro = never a prob.

IC7600 and Win7Pro implies no joy changing between RMS Ex and V4Chat.

I was called upon for helping making the Oslo Ham group main station QRV in those modes RMS Ex, V4Chat and AirMail.

Internal USB, updated driver, filter set, freq set and PTT all done through the USB cable. WINMOR in RMS E working No prob.

Also Excellent with a added PTC2Pro and a real serial port for connection to the serial port on the PTC.

Only cable from PTC to Rig ACC1 was the 8pin sound/ptt cable.

Freq controll via external USB (CIV com port), NOT trying internal frq controll form the PTC.

Installed AirMail as well still using PTC2Pro and the same real Serial Port, and Freq change via the same USB (CIV Com port).

All working excellent. Shutting down one program, and starting the other.

Offers me K2K as well in Pactor modes.

Wanted adding the V4Chat. Here the MESS started.

I found NO way making it work. No help in the obvious shutting down of RMSE and / or AirMail.

V4Chat made a Mess of the setup of RMSE.

Or the other way around.

I did not find any way finding a working port set up for RMS E OR V4, since both freq controll and cat CIV PTT is done to the same Rig.

I ended up uninstalling V4Chat for offering them a Well working "klient proof" system. (I checked the Icom Adress and speed 19200 as well, even if getting tired after 4 hours of work.) I HOPE I did some obvious errors, but don't know.

What NOT tested yet was a full REBOOT between any change between RMS E and V4CHAT. IF that helps, it will probably be too cumbersome for users.

Not needed switching between RMS E and AIrMail 3.4.062.

At home with Signalink and manual freq controll, I can run RMS E Winmor, V4Chat and FLDIGI all QRV for listening at the same time and will not leave such a setup for my private use. Automatic FREQ change off course not working, but is no big deal compared to the huge advantage of simultanuous QRV.

But for the club clients, or for boaters, I wonder: Either K2K WINMOR option, even if not slick (and K2K Pactor option) is needed within the SAME PROGRAM using the SAME COMPORTS after finally found a setup working for a crucial program, by means of ELMERS.

What did I do wrong?

If I did it all correct, I wonder if introducing WINMOR CHAT, V4CHAT (or H4Chat or whatever future may introduce) as an integrated part of RMS E may be needed for avoiding the port conflicts using those new rigs for secure use by new eager, but unexperienced digimode clients enthusiasts.

I still get requests from fellow countrymen about some easy K2K ARQ soundcard (and Pactor) option WITHIN RMS E. Hence my V4 Try since knowing it works well with SignaLink.

I have also got an old experienced army Amtor and later Pactor specialist getting very enthusiastic about V4, and done many ARQ tests.

This is no issue for a RMS Trimode special Server station running IC7200, or any other dedicated modern soundcard radio TS590 or whatever.

Issue is for new CLIENT use? And always new ones......

Anybody having a good guideline?

I don't like that I failed finding a way out of this probably com port mess.

Intention was not and is not running simultanuous with those new rigs, but one at a time without the need of rebooting PC in between.

3953. old news?

Yahoo group: V4Protocol
Date: 2014-04-11 20:58:18 UTC
From: Oliver Johns
Topic: 3953 Message: 3953

This may be old news, in which case my apologies.

I've got the 0.2.2.0 beta of Chat running on Windows 7 Home in a Virtual Box on a MacBook Air laptop. I use a SignaLink external USB sound card to connect to my Elecraft K3. Wasted some time trying to get the SignaLink to be recognized by Windows 7. But that's now how Virtual Box does audio. The obvious (even to me, finally) solution is to go to the Mac OSX audio preferences and set the *Mac* itself to connect to the SignaLink. Then back to Virtual Box and Windows 7. Tell Chat to connect to the usual Windows sound system (the only available choice in the Setup panel). Virtual Box pipes the Mac audio in and out to the Windows system and everything seems to work robustly.

Now I need someone to talk to. I have no HF antenna, so am limited to 2 meters. Anyone in the San Francisco Bay Area interested in a 2 meter test of Chat and H4FSK?

73,

Oliver

3957. Getting started

Yahoo group: V4Protocol
Date: 2014-04-30 14:40:07 UTC
From: <jasdjensen@...>
Topic: 3957 Message: 3957

I have TNC 1.0.2.0 and V4 Chat 1.0.4.0 and I'm listening on 14.073 usb.

I'm not sure what mode I should be in for best results. I just want to see if I can decode someone else. I've sent a CQ in ARQ mode and have been listening on FEC mode.

Is there a FAQ or a Quick start guide somewhere?

Thanks.

I did figure out that I was using the wrong program.

I had wanted to try out the H4FSK but downloaded the V4 instead.

So now I'm running H4FSK 0.2.2.0 and Chat 0.2.2.0 and am learning how to use it.

Would love to do a test QSO with someone.

Will hang out on 14.073 as time allows.

Hi Major Pat..

Go to Winlink.org the FTP site. You will see V4 programs on their site. I don't spend to much time on V4. as I'm on 14065 Satern Digital Net..

Bear in mind, you need to use the FEC mode for H4 Chat . As I understand it the developer has not yet completed development of the ARQ mode yet.

Hi Jason

I was so busy today that I did not have time to get on the radio.
There used to be a site where you could indicate when you would be
monitoring but I never used it. Here is what I suggest.

Use V4 chat on 14073 and call CQ several times. I have found most of the
activity in the afternoons

Use Chat 0.2.2.0 on 10123 and setup the beacon to send every 5 or 10
minutes. Use FEC RBST as it is the only mode working now. I hope ARQ will
be available soon.

If you take a close look at the screenshot in the April issue of QST you
will see my beacon transmission.

Are you retired or available during the day? If you want to give me your
telephone number I would be glad to call you when conditions appear to be
good.

Hope to connect soon

73 Harry W9IB

3970. H4Chat vs. V4

Yahoo group: V4Protocol
Date: 2014-05-04 17:37:03 UTC
From: Ed
Topic: 841 Message: 3970

I am rather excited about the digital program developments Rick has made with the V4 and H4 Chat programs ... I have never liked to use the error prone PSK31 for narrowband keyboard digital mode, and Rick's development of an ARQ keyboard program seems to be just what I was looking for.

However, there are TWO programs available...one fully functional with ARQ, and the other not yet completed and only works with FEC.

My question: What are you using? V4 or H4 Chat? I would like to start dabbling in this again after a lengthy absence, and there are few enough hams using these programs anyway..I'd like to concentrate my efforts on the program most are operating with ...V4 with ARQ or H4 with just FEC?

A more clear definition of your problem would also be helpful. I don't even know what hardware or software you are using.. V4 or H4. Either case, there seems to be very little traffic on on the bands with those modes.

Had no problem setting up on my Win7 computer. Can't speak to any differences with Vista.

Hi Ed K7AAT and also Neil and Johnathan,

First, yes, I am rapidly getting to the point where I might have to move on from Vista, tho it WAS new once. hi. On the computer hardware here it is a Dell Inspiron 519 (desk-top machine) with an AMD Athlon CPU. Although it does have an inbuilt sound card, I'm using an external USB connected unit. (Until recently I was using an HP with xP and had thought, tho clearly not HARD enough, that this Vista machine was a move forward!!) Loads of memory, tho the system is quite heavily loaded with software.

As for the software, well its the regular download with H4 and the Chat modes, and mainly I've been trying to get the Chat mode to talk to the radio. The radio interface is a Rigblaster "nomic", and I have used that for the last couple of years on JT65-hf with no problems. Using the older HP + xP equipment, it was producing (from its DB9 port) a send/recv changeover for the xcvr. Now, with the Vista machine (which has no DB9) I'm using VOX control and the "nomic" is really just an interface.

Just for the record, it all works fine with JT65-hf, even though I am at the moment running a Kenwood TS820-S on just 20 and 40 meters.

However, when I try to persuade Chat mode (v4Protocol) to set up, it does not see or decode audio from the TS820 and I've also failed to find the proper volume controls to maybe increase signal level. Incidentally, I had the same sort of failures when I tried (on a different machine) using v.13 and then also v.9.10 Ubuntu .

These are my first complete failures since I started with RTTY in 1975, so maybe it's just my age. <grin> but JT65 still works when I change back to it.

Topic: 3983 Message: 3983

Wanting to try out my new ic-7200, I spent a couple days earlier in the week calling ARQ CQ with v4chat on 10.123, 10.131, and 14.073 in one- and two-hour sessions a few times a day and evening. I also listened around these frequencies as well as tuning around digital areas for others calling CQ or engaged in a QSO.

I don't have internet access out in the shack so I can't use any online systems to post my availability.

Perhaps there are now just so many digital modes available that folks feel overwhelmed and are just falling back on psk31?

Wanting to try out my new ic-7200, I spent a couple days earlier in the week calling ARQ CQ with v4chat on 10.123, 10.131, and 14.073 in one- and two-hour sessions a few times a day and evening. I also listened around these frequencies as well as tuning around digital areas for others calling CQ or engaged in a QSO.

I don't have internet access out in the shack so I can't use any online systems to post my availability.

Perhaps there are now just so many digital modes available that folks feel overwhelmed and are just falling back on psk31?

I spent some time (a couple of weeks) playing with V4Chat and its variants. Normally (on the digital side) I run PSKxx (various speeds), Olivia, etc. as well as RTTY and CW (both digital, right?) I found V4Chat to be downright retro -- slow and _*very*_ poor when S/N was low. I think the reason you are not finding any contacts is because, like me, many others have tried it and found it wanting.

To add to my previous comment about V4Chat in poor S/N conditions...just take a quick think about the /bandwidth /of this mode compared to, e.g. PSK31. PSKxx may seem old hat, but it is a very good mode wrt required bandwidth (even the higher-speed versions)...and there is nothing like seeing an Olivia signal rising from the noise, like Lazarus from the dead), where there was apparently no hope.

My own opinions on this issue -- I have not been active for some time as I have been patiently waiting for completion of the development of H4Chat - the ARQ function. As far as speed and bandwidth go, I am somewhat unhappy with most of the digital modes, PSK31 included, due to constant errors popping up unless the signal is constantly strong. I remain very excited about a keyboard to keyboard digital mode that will have FORWARD error correction.

Perhaps this Winter I will take another stab at using V4Chat ARQ on 14.073 .

From: Rick Muething
Topic: 3985 Message: 3988

John, All,

I am the author of V4 and V4 chat. protocols and programs I developed a number of years ago. Like all programs and protocols they were a learning tool and have some good features and some shortcomings. Unfortunately I don't have time these days to coordinate frequencies or promote and improve these protocols.

I have been spending time the last year or so working on a protocol (and implementation) with a few other developers that is an ambitious effort and one I think will be productive.it is called ARDOP for Amateur Radio Digital Open Protocol. I have summarized some of the basic concepts of it below and I am now testing and optimizing various implementations. The goal is to provide a protocol with implementations (virtual TNCs) on several platforms to encourage development of advanced digital modes. My first implementation will be on Windows using VB.NET on VS 2010 but future versions will employ C♯ on Windows, Mac and Linux OS.

Basic ARDOP objectives:

1) Bandwidth: The protocol is intended to operate in one of four bandwidths, 200 Hz 500 Hz, 1000 Hz, and 2000 Hz as measured at the -30 dB points of the transmitted spectrum. There be three methods of establishing a connected session bandwidth: i.e. Forced by Client, Forced by Server, and Negotiated by lower of Server or Client. The Server will have the ability to reject a connection request that is not compatible with the servers selected bandwidth or when the server detects prior signals in the passband. (Listen before Transmit or Busy Detector)

2) Speed - Robustness Agility: The protocol is intended to be able to automatically operate over a wide range of data rate and robustness levels. It should adapt to propagation seeking the best nominal modulation (and bandwidth in some cases) to maximize net error free throughput. It is anticipated a range in net (after FEC) throughput will be in excess of 20:1 (slowest and most robust 200 Hz or 500 Hz mode to fastest and least robust 2000 Hz mode).

3) Minimum Crest Factor: The use of techniques such phase staggered carriers will be used to minimize the crest factor (Peak to RMS Power) to 3.5:1 or less (a pure sine wave has a Peak to Average crest factor of 1.41). This will maximize transmitted energy from a transmitter limited to a max PEP rating (most amateur SSB transmitters)

4) Compliance with US FCC Symbol rate rule: The maximum symbol rate on any carrier shall be 300 baud or less. This is in conformance to the current US FCC rules. The protocol shall allow modification extensions to symbol rates > 300 baud if and when the FCC rules are changed.

5) Strong Resistance to Multipath propagation: The protocol shall use techniques (low symbol rates, OFDM carrier cyclic prefix, path compensation, strong FEC etc. to optimize performance under poor multipath conditions (path delay variation up to 5 ms).

6) Interference Avoidance: The implementation shall include features such as listen before transmit and busy detectors and the ability to reject connections or change bandwidths if channels are detected busy.

7) Implementation: It is anticipated there will be several implementations compatible with a number of platforms. These will include Windows, Linux, Mac (with Parallells or VM Ware if needed) and dedicated single chip CPUs or DSPs. DSP implementation will be chosen to minimize the demand for high speed floating point and extensive CPU DSP loading.

8) Operating Modes and Radios: Though primarily intended for HF SSB operation the protocol will operate with and accommodate other operational modes such as VHF/UHF SSB and FM. Timing parameters will cover extended range to accommodate these mode as well as SDR (Software Defined Radios e.g. Flex) . The ARDOP protocol will support both Connected (ARQ) and Broadcast (FEC only) protocols.

9) Open Protocol: The definitions, detailed specifications and source code of ARDOP will be open source for ham radio applications. Provision are made in the protocol to allow experimentation of new modes and coding while maintaining compatibility with existing implementations. A conformance spec and test will assure any implementation or adaptation retains core compatibility with prior versions.

With the programming skill sets out there and the CPU power of today's even modest tablet computers or dedicated CPU chips we can do a LOT better than PSK 31 in terms of speed, robustness, functionality and flexibility. If you are an experienced programmer and want to get involved in the protocol development of in the development of clients or servers that use the protocol (interface to the "virtual TNC") drop me a line and I'll send you some preliminary data and ARDOP documents.

73,

Walt/All.

Virtually all digital modes (except PSK31 BPSK) have some form of FEC (forward error correction). This is simply the use of additional redundancy bits/codes that can correct SOME errors. If the number of errors (due to interference or marginal propagation) is within the correction range of the FEC you get perfect printout.otherwise you get some errors. If you want TRUE error free transmission (e.g. email addresses, bank account numbers, nuclear launch codes!) you can't rely on just FEC. you need ARQ (Automatic Retry reQuest). This insures (by a back channel handshake) that the receiving station received AND CORRECTLY DECODED the message. This is used in protocols like Pactor, WINMOR, Packet and many other ARQ protocols. All ARQ modes involve some additional overhead and latency for the back channel ACK/NAK communications. it is the necessary price to pay for net error free communications.

GA Ed,

When it comes to digital modes, I think "Pick two, any two!" applies.
You can't have all three at the same time!
1. Speed
2. Accuracy / robustness
3. Narrow bandwidth

It has been awhile since I have operated some of the digital modes
available but I am pretty sure that there are some modes that use, or have,
FEC available. But they still don't always give 100% copy and when used it
slows the through-put down and people get tired of waiting for the info to
come through. . If you want 25+ wpm conversations at nearly perfect copy,
your mode choices are going to be slim to none.

You "pays your money" and "takes your choice"!

I meant to say in my original comment, below, that I was eagerly looking forward to a keyboard to keyboard digital mode that had ARQ, not FEC.

As far as my three choices below, I would take accuracy and narrow bandwidth over speed. However “narrow” bandwidth is a relative term and I see no reason we can’t have a good ARQ mode with moderate typing speeds at a reasonable bandwidth…. Not necessarily as narrow as PSK31, but just a bit more, perhaps.

After reading Rick’s subsequent comments, I just say perhaps he is on the right track with ARDOP. I need to brush up on this.

Yes Ed,

It is possible as long as you allow some expansion of the bandwidth from the 60 Hz or so of PSK31.

For example the 4PSK 100 baud mode of ARDOP can achieve a fairly robust (using strong FEC) ARQ throughput of about 85 words per minute (uncompressed text) with a max latency of < 2 seconds and a bandwidth of 200 Hz (@ -30 dB). That can accommodate even a very good typist on a keyboard to keyboard ARQ connection.

That same 4PSK mode using compressed text and a longer 4-5 second frame (like you would use during message transfer) would support a max ARQ error free throughput of about 270 words per minute in the same 200 Hz bandwidth.

There is no magic here. In 1948 Claude Shannon presented his theory (now well proven) that relates the maximum capacity of a communication channel to the signal to noise within that channel. With better DSP processing and stronger FEC coding we are just now better able to approach Shannon’s theoretical limits.

3998. ANNOUNCE: Build590 CAT library for bilingual TS-590 apps

Yahoo group: V4Protocol
Date: 2014-12-05 16:02:29 UTC
From: Ian_Wade_G3NRW
Topic: 3998 Message: 3998

ANNOUNCE: Build590 CAT library for bilingual TS-590 apps

Developers of third-party apps for both the TS-590SG and the TS 590S will realize that each radio has its own CAT Command Set. The commands in each radio are very similar, certainly, but unfortunately they are not identical – in fact, there are more than 250 differences in detail in the CAT commands and their parameters between the two radios.

This means that apps need first to detect which radio they are communicating with, and then use the appropriate CAT Command Set. To make this task easier, the Build590 CAT Development Library has been developed.

Build590 is written in BBC BASIC for Windows (BB4W), but should be easily adaptable to different languages or DLLs. The User Guide contains the full listing of Build590 for reference. The listing is also available as a plain text file for incorporation within apps programs.

To download the Build590 User Guide and library listing, go to the "TS-590 Family Resources Page":

http://homepage.ntlworld.com/wadei/ts-590s.htm

Click on the green "COMMON" button, then on "GENERAL TECHNOTES".

Then download TechNote #14: "Build590 CAT Library" and unzip into any convenient folder.

To TS-590SG Owners: An Appeal for Help.

I am collecting information on how third-party software actually works with the TS-590SG. The software includes all the well-known digital apps (fldigi, mixw, MMTTY, digipan, DV, SSTV etc etc etc), loggers, antenna controllers, HRD, DxLab etc etc.

With luck these programs will (more or less) work with the TS-590SG, but some may not work at all because of the differences between the TS-590SG and TS-590S CAT Command Sets.

If you have tried running any of this software with the TS-590SG, please let me know details of your experiences, at:

mailto: g3nrw-radio@...

I am compiling a detailed table for publication on the Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Click on the red "TS-590SG" button, then on the "TS-590SG APPS COMPATIBILITY" button. The table there is virtually empty right now -- please help me fill in the blanks.

Thank you.

Hi Rick.

Are you sitting comfortably? There are 4 documents you need to read.

Go to the "TS-590 Family Resources Page":

http://homepage.ntlworld.com/wadei/ts-590s.htm

Click on the red "TS-590SG" button, then on the "TS-590SG DOCUMENTATION" button.

Then download document #3: "TS-590S/TS-590SG PC Control Command Reference Guide" for the new CAT Command Manual. This is common to both the TS-590S and TS-590SG, but you have to read it carefully for notes explaining where certain commands do/don't apply in one radio or the other, and where certain command availability in the TS-590S depends on the TS-590S firmware version.

Then for the errors in the manual, download document #4:
"TS-590S/TS-590SG PC Control Command Reference Guide: ERRATA".

Then on the Resources Home Page, click on the green "COMMON" button, then on "GENERAL TECHNOTES".

Then download TechNote #13: "TS-590SG Whitepaper: Software Incompatibilities with the TS-590S".

And finally, download TechNote #14: "Build590 CAT Library". This new library defines all the constants (for example, menu numbers) that differ between the two radios. I have used this library for a new app that I'm completing.

You will find you can easily adapt the library to your own operating environment, then you just install the library with every app that you want to run with the two radios -- it saves you having to include (possibly many) statements of the form:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
IF radio=TS-590SG THEN
do_this_for_the_TS-590SG

ELSE do_that_for_the_TS-590S
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

```
ENDIF
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

That's all!

Good luck.

4004. Latest version?

Yahoo group: V4Protocol
Date: 2015-02-12 22:13:49 UTC
From: Ian_Wade_G3NRW
Topic: 4004 Message: 4004

I am revisiting V4 after a long break. Can someone point me to the latest version.

Thanks.

Updating the "30m Band Utilization Chart"
~~~~~~

Seeing this the other day in a message from Tony, K2MO:

> The 30 meter (10144.0 USB) frequency appears to be the
> watering hole for FSQCALL.

reminds me that it is about time I updated the "30m Band Utilization
Chart". The "current" (19 February 2014) version is here:

http://homepage.ntlworld.com/wadei/140219_30m_Band_Utilization_Chart.pdf

Please let me know if any modes should be added/changed/removed from the
chart.

Reminder: the chart is not a bandplan. It is an attempt to show the
actual utilization of the band, which isn't necessarily where you
think activity should or should not be.

Hi Bernie,

There is a newer version of the V4 Chat called H4 Chat. Unfortunately the project seems to have died. Rick, the developer, got busy with something else. I don't know if he plans to return to the H4 project or just let it be. We're hopeful but only Rick knows what he plans to do with H4 Chat.

You may be hearing ALE-400. That is another ARQ mode supported in MultiPSK. There is some activity with it. You might try decoding with that and see what success you get.

OK thanks for the replies. I just had a V4 QSO with Lee, NR5G so I know the program works. Too bad the program did not catch on -- works quite well but I understand that there is a lockup bug lurking in the code. It would be nice if that were fixed sometime in the future.

A lot of effort goes into developing these programs ...

Bernie,

I am working with some other developers on a new protocol (with roots to WINMOR and V4) that should be a better performer and have more capabilities. It is called ARDOP (Amateur Radio Digital Open Protocol). It will operate over 4 bandwidths (200 Hz, 500 Hz, 1000 Hz, and 2000 Hz) and in both FEC (unconnected or broadcast) or ARQ (connected) modes. I expect the first Windows alpha release of the program (TNC and Host) now in testing) to be in late April. The source will be open and other OS versions are in process.

You are welcome to sign up for the users group of ARDOP by sending an email to ardop_users-subscribe@yahoogroups.com

I'll announce on this forum more details when we are closer to release.

73.

Rick Muething, KN6KB Author of V4 and WINMOR.

4014. ARDOP Protocol Group

Yahoo group: V4Protocol
Date: 2015-05-13 12:26:04 UTC
From: Rick Muething
Topic: 4014 Message: 4014

All,

V4 and H4 were earlier efforts at simple protocols I developed for keyboarding and chats. A lot was learned from these and WINMOR the sound card protocol used in Winlink. A number of developers have been working over the past year to develop a new open protocol called ARDOP (Amateur Radio Digital Open Protocol). This a well-designed protocol that can operate either FEC or ARQ with fbandwidths of 200 Hz (optimum for keyboarding), 500, 1000 and 2000 Hz at speeds that range from 300 to 17000 bytes per minute depending on bandwidth and propagation. The protocol contains a number of innovative features such as back channel quality reporting (including the quality of the received frame in the ARQ ACK or NAK acknowledgement), automatic timing adjustment, automatic bandwidth negotiation and effective busy channel detection)

ARDOP will (after Beta testing) be offered to support multiple operating systems and the source code will be released. An ARDOP_Win TNC and keyboard Host (ARDOP_Chat) are now in Alpha testing.

If you are not already a member you are invited to join the ARDOP groups and participate in testing and protocol and product feedback. The links below should be used to send an email request for membership.

For ARDOP Users: ardop_users-subscribe@yahoogroups.com

Yahoo Group:
https://groups.yahoo.com/neo/groups/ardop_users/info

For ARDOP Developers: : ardop_development-subscribe@yahoogroups.com

Yahoo Group:
https://groups.yahoo.com/neo/groups/ardop_development/info

Both group sites contain files for the full install software, specifications, performance data, and objectives of the ARDOP protocol.

Your interest and support appreciated.

73,

Rick Muething, KN6KB Developer of SCAMP, WINMOR, V4, H4 and ARDOP.
